# SPECIFICATIONS

	PWR 18-2	PWR 36-1
<b>OUTPUT VOLTAGE</b>		
Output voltage	0 to +18V/-18V	0 to +36V/-36V
Setting resolution	10 mV	
Max. output voltage	+18V/-18V	+36V/-36V
Dual tracking	0 to $\pm$ 18V	0 to $\pm$ 36V
Tracking deviation	$\pm$ (1% + 40 mV) of rated voltage	$\pm$ (1% + 80 mV) of rated voltage
<b>OUTPUT CURRENT</b>		
Output current	0 to +2A / 0 to -2A	0 to +1A / 0 to -1A
Setting resolution	10 mA	
Max. output current	+2A/-2A	+1A/-1A
Dual tracking	0 to $\pm$ 2A	0 to $\pm$ 1A
Tracking deviation	(2% + 40 mA) of rated current	
<b>CONSTANT VOLTAGE CHARACTERISTICS</b>		
Input fluctuation (for surge of AC $\pm$ 10%)	1 mV	2 mV
Load fluctuation (for surge of 0 to 100%)	3 mV	2 mV
Ripple/noise rms (10 Hz to 1 MHz)	0.5 mV rms	
Ripple peak (p-p)	2.8 mV p-p	
Transient response	50 $\mu$ s typical	
Temperature coefficient	100 ppm/°C typical	
<b>CONSTANT CURRENT CHARACTERISTICS</b>		
Input fluctuation (for surge of AC $\pm$ 10%)	2 mA typical	
Load fluctuation (for surge of 0 to 100%)	10 mA typical	
Ripple/noise rms (10 Hz to 1 MHz)	2 mA rms typical	
Ripple peak (p-p)	5.6 mA p-p typical	
Temperature coefficient	300 ppm/°C typical	
<b>VOLTMETER</b>		
Display (3-1/2 digit LED)	max. 19.99V, fixed range red LED	max. 19.99V/99.9V, auto range red LED
Accuracy (output "ON") (23°C $\pm$ 5°C, less than 80% RH)	$\pm$ (0.5% rdg + 2 digit)	Low range: $\pm$ (0.5% rdg + 4 digit) High range: $\pm$ (0.5% rdg + 1 digit)
<b>AMPMETER</b>		
Display (3 digit LED)	max. 9.99 A, fixed range red LED	
$\pm$ Accuracy (output "ON")	(1.0% rdg + 2 digit) 23°C $\pm$ 5°C, less than 80% RH

FUNCTIONS		
Output ON/OFF	ON/OFF switch. However, output cannot be ON when MEMORY ON. Red LED lights up when ON.	
Output protect ON/OFF	Disables the output of unexpected voltage and current in the output mode. This 'PROTECT' function becomes active when a different value is set by one of the PRESET, VARIABLE and TRACKING keys in the output mode. (ON → Red LED active)	
Preset (1,2,3)	3 voltages or currents can be preset as desired. Preset values can be easily checked. Green LED lights up when ON.	
Memory	Several voltage and current presets can be stored. Red LED lights when ON.	
Key Lock	Locks all functions as set. All controls except POWER are disabled. Red LED.	
V/A	Several voltages and currents can be set. Green LED.	
Tracking and V/A display selection	± 18V tracking, + 18V, – 18V	± 36V tracking, + 36V, – 36V
OUTPUT		
COM	± 18V COM common	± 36V common
Polarity	COM, positive or negative ground possible	
Output terminals	+ (red), – (white), COM (blue), GND (black)	
Ground proof voltage	± 250V DC	
SERIAL OUTPUT	0 to 36V	0 to 72V
OPERATION CONDITIONS		
Rated temperature/humidity range	0 to 40°C, 10~85% RH	
Operation temperature/humidity range	0 to 40°C, 10~85% RH	
Storage temperature/humidity range	– 20 to 65°C, 10~85% RH	
Cooling mechanism	Natural convection	
POWER CONSUMPTION		
VA/W (at AC 100V)	approx. 210 VA / 165 W	approx. 190 VA / 145 W
INPUT VOLTAGE		
Voltage, Frequency	AC 100V / 120V / 220V / 240V ± 10% 50/60 Hz Internal switching possible.	
DIMENSIONS AND WEIGHT		
Dimensions	width: 104 mm height: 147 mm depth: 330 mm	
Max. dimensions	width: 109 mm height: 167 mm depth: 350 mm	
Weight	approx. 6.4 kg	
Accessory items	1 instruction manual 1 power supply cord 2 fuses 1 modular cable	

■ Circuit and ratings are subject to change without notice due to developments in technology.

# SAFETY

## SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

### Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

### Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the instrument at earth ground. Do not attempt to defeat the ground wire connection or float the instrument; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

The optional power cords are shown as follows in Fig. 1.

### Line fuse

The fuse holder is located inside the instrument and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

### Voltage conversion

This instrument may be operated from either a 100 V to 240 V, 50/60 Hz power source. Use the following procedure to change from 100 to 240 volt operation or vice versa.

1. Remove the case. Change the power voltage according to instruction manual.
2. Replace the fuse with a fuse of appropriate value, 2 amp for 100 VAC to 120 VAC operation, 1.5 amp for 220 VAC to 240 VAC operation.
3. When performing the reinsertion of fuse for the voltage conversion, the appropriate power cord should be used. (See Fig. 1.)

Plug configuration	Power cord and plug type	Factory installed instrument fuse	Line cord plug fuse	Parts No. for power cord set
	North American 120 volt/60 Hz Rated 15 amp (12 amp max; NEC)	2 A, 250 V Slow blow 6×30 mm	None	E30-1951-05

Fig. 1 Power Input Voltage Configuration

# CIRCUIT DESCRIPTION

## **± 12 V AND + 5V GENERATOR**

The ± 12 V and + 5 V AC voltages, from the AC Power Transformer T1, are first transformed into ± DC power by a center-tap type control rectifier (D1) and (C1 and C2). The center tap of the transformer is used as the reference. A + 12 V is then output through U2b and Q1 control circuits with the zener voltage (D4) as the reference voltage. The + 12 V input into the U2 circuit becomes the output as a + 5 V current, while that input into the U2a and Q2 control circuits becomes output as -12 V, with the center tap as the reference point of potential.

The resulting ± 12 V and + 5 V are used as the control power source of the main power source and their reference of all center taps. The potentials are directly connected to the COM.

## **AC POWER SWITCH (K1) AND AC POWER DRIVE (Q5)**

The main AC power source, for the main power source positive output, is input from the AC Power Transformer T1. Two types of potentials, based on one tap references, are input as the AC power source voltage. As a transfer relay is used in K1, only one potential can be provided for the Rectifier and Smoother into which the current is next passed through.

The AC Power Switch K1 is controlled by the AC Power Drive Transistor Q5. When Q5 is ON, K1 provides a high voltage to the Rectifier and Smoother. When Q5 is OFF, K1 provides a low voltage to the same.

## **AC POWER SWITCH (K2) AND AC POWER DRIVE (Q6)**

The main AC power source, for the main power source negative output, is input from the AC Power Transformer T1. The concept here is the same as for the positive output, except that K1 is replaced by K2 and Q5 is replaced by Q6.

## **RECTIFIER AND SMOOTHER (D21 AND C31)**

AC Power output from K1 is transformed into DC power.

## **RECTIFIER AND SMOOTHER (D22 and C32)**

AC power output from K2 is transformed into DC power.

## **SERIES PASS TRANSISTORS (Q11, Q12 AND Q15)**

Unstable DC power, output from D21 and C31, becomes stabilized. Transistor (Q11, Q12, and Q15) for PNP coupling are connected in series and regulated I signals output by amplifiers (Q3 and R45).

## **SERIES PASS TRANSISTORS (Q13, Q14 AND Q16)**

Unstable DC power, output from D22 and C32, becomes stabilized. Transistors (Q13, Q14, and Q16) for NPN coupling

are connected in series and controlled by signals output from amplifiers (Q4 and R16).

## **CURRENT DETECTOR (R57) AND VOLTAGE DIVIDER (VR3 AND R55)**

Stable DC power output from Q11, Q12, and Q15 is led to the Power ON/OFF [K102 (1/2)] Switch via R57. The electric current input into R57 becomes output as voltage. This voltage input through VR3 and R55 becomes potential divided and in turn input into the Error Current Amplifier U10a.

## **CURRENT DETECTOR (R58) AND VOLTAGE DIVIDER (VR4 AND R56)**

Stable DC power output from Q13, Q14, and Q16 is led to the Power ON/OFF [K102 (2/2)] Switch via R58. The electric current input into R58 becomes output as voltage. This voltage input through VR4 and R56 becomes potential divided and in turn input into the Error Current Amplifier U11a.

## **POWER ON/OFF [K102 (1/2) AND K102 (2/2)] SWITCHES AND POWER ON/OFF DRIVE**

Each ± DC power voltage, output from R57 and R58, passes through the Power ON/OFF Switch and in turn output from the Power Source ± Output Terminal. K102 (1/2) outputs positive power while K102 (2/2) outputs negative power. K102(1/2) and K102(2/2) each use two units of relays and the ON/OFF of ± the output is done simultaneously. K102 is controlled by the Power Output ON/OFF Drive (Q101). K102 is ON when Q101 is ON and power is output. When Q101 is OFF, K102 is OFF and no power is output.

## **POWER OUTPUT DETECTION SWITCHES [K101 (1/2 AND 2/2)] POWER OUTPUT DETECTION DRIVE (Q103), AND SIGNAL DELAY (U102, D110, R127, AND C12)**

For power output adjustment, positive voltage is input into K101 (1/2) and negative voltage is input into K101 (2/2). Output is made to each corresponding voltage divider. Both K101 (1/2) and K101 (2/2) constitute transfer relays and each one side is connected to the output side of K102 while each other side is connected to the opposite side, i.e. opposite the output side of K102. Both K101 (1/2) and K101 (2/2) consist of 2 relay units and adjustment of the power output detection location is done simultaneously. When power is output through the main power source, potential detection is made on the sides of K101 (1/2) and K101 (2/2) which are on the output sides of K102. When there is no power output, power detection is made on the sides which are opposite the K102 output. K101 is controlled by the Power Output Detection Drive (Q101). When Q103 is ON, both K101 (1/2) and (2/2) become connected to each output side. When Q103 is OFF, the same become connected to the side opposite the output side.

# CIRCUIT DESCRIPTION

Q103 is controlled by the signals from the Signal Delay (U102, D110, R124, and C12). The signals which turn Q101 to ON/OFF are buffered and sent as signals which turn Q103 to ON/OFF. Signals sent to Q103, versus those sent to Q103 ON/OFF. Signals sent to Q103, versus those sent to Q101, become delayed when Q103 is ON.

## VOLTAGE DIVIDERS (R35, R37)

The electrical potentials output from K101(1/2) and 101(2/2) are divided by voltage dividers R35 and R37. The divided potentials are then input into the reference voltage selector U8 (Y).

## VOLTAGE DIVIDERS (R28)

R28 is the Complex resistor of 2K and 10K (PWR36-1 is 1K and 10K).

The electrical potentials of K101 (1/2) are output to the 10K resistor, while the electrical potentials of reference voltage generator V (U10b, 15, R51, C19, 30) are output to the 2K (PWR36-1 is 1K) resistor.

Furthermore, the electrical potentials of COM of the 2K and 10K (PWR36-1 is 1K and 10K) resistors are output to the error voltage amplifier (U12b).

## VOLTAGE DIVIDERS (R30)

R30 is the Complex resistor of 2K and 10K (PWR36-1 is 1K and 10K).

The electrical potentials of K101 (2/2) are output to the 10K resistor, while the electrical potentials of reference voltage generator V (U11b, 16, R53, C21, 29) are output to the 2K (PWR36-1 is 1K) resistor.

Furthermore, the electrical potentials of COM of the 2K and 10K (PWR36-1 is 1K and 10K) resistors are output to the error voltage amplifier (U12a).

## ERROR CURRENT AMPLIFIER (U10a)

The electrical potentials output from the Voltage Dividers (VR3 and R55) and those output from Reference Voltage Generator A (R52 and C20) are compared and their errors amplified. They are then input into the signal Selectors (D8 and D9).

## ERROR CURRENT AMPLIFIER (U11a)

The electrical potentials output from the Voltage Dividers (VR4 and R56) and those output from the Reference Voltage Generator A (R54 and C22) are compared and their errors amplified. They are then input into Signal Selectors (D10 and D11).

## ERROR VOLTAGE AMPLIFIER (U12b, R28)

The electrical potentials output from the Voltage Dividers (R28) and those output from Reference Voltage Generator V (U10 b) are compared and their errors amplified. They are then input into Signal Selectors (D8 and D9).

## ERROR VOLTAGE AMPLIFIER (U13a, R30)

The electrical potentials output from the Voltage Dividers (R30) and those output from Reference Voltage Generator A (U11 b) are compared and their errors amplified. They are then input into Signal Selectors (D10 and D11).

## SIGNAL SELECTORS (D8 AND D9) AND SIGNAL AMPLIFIERS (Q3 AND R45)

D8 and D9 constitute cathode commons. Signals, either output from U10a or U12b, are selected depending on their potential condition and in turn input into signal amplifiers (Q3 and R45). Q3 versus Q11, Q12, and Q15 are Darlington-connected in two layers.

## SIGNAL SELECTORS (D10 AND D11) AND SIGNAL AMPLIFIERS (Q4 AND R46)

D10 and D11 constitute encode commons. Signals, either output from U11a or U13a, are selected depending on their potential condition and in turn input into signal amplifiers (Q4 and R46). Q4 versus Q13, Q14, and Q16 are Darlington-connected in two layers.

## COMPARISON VOLTAGE GENERATORS (R39 - R41)

The reference voltage is generated from  $\pm 12$  V for establishing whether the main power source  $\pm$  power output is CV or CC. Potentials for positive power output are negative and are input into Comparator (U12a), While those for the negative power output are positive and are input into Comparator (U13b).

## COMPARATORS (U12a AND U13b)

A comparison is made between signals from the Error Current Amplifiers and the Comparison Voltage Generator to establish whether the main power source  $\pm$  power output is CV or CC. The condition of the power output is determined and the corresponding signal is input into the CPU.

## REFERENCE VOLTAGE GENERATOR V (U10b, U15, R51, C19, AND C30)

The reference voltage for the negative power output is generated by U16, R53, C21, and C29, and led through the buffer constituting U11 b, and output as the reference voltage. The voltage is normally a positive potential.

## REFERENCE VOLTAGE GENERATOR V (U11b, U16, R53, C21, AND C29)

The reference voltage for the positive power output is generated by U16, R53, C21, and C29, and led through the buffer constituting U11 b, and output as the reference voltage. The voltage is normally a positive potential.

# CIRCUIT DESCRIPTION

## REFERENCE VOLTAGE GENERATOR A (R52 AND C20)

The reference voltage for the positive output current is generated by R52 and C20. The voltage is normally a negative potential.

## REFERENCE VOLTAGE GENERATOR A (R54 AND C22)

The reference voltage for the negative output current is generated by R54 and C22. The voltage is normally a positive potential.

## + V TIMING (U17b) AND - V TIMING (U17c) GENERATORS

These constitute 3 input AND circuits. Each U15 and U16 functions in a conducting condition in case the positive/negative voltage in Reference Voltage Generator V is reset. With the exception of the above case, a non-conducting condition is maintained and the positive/negative voltage generating capacity of Reference Voltage Generator V is increased.

## REFERENCE VOLTAGE SELECTOR [U8 (Y)]

The reference voltage of each positive and negative voltage and 1 potential, out of the 4 current potentials, are selected and output into the following Reference Voltage Selectors. This selector, controlled by 3 digital signals (D17, D19, and D20), becomes non-conductive when selection is being carried out.

D17	D19	D20	Conductivity & selected potential
H	—	—	Non-conductive
L	L	L	Positive reference voltage value
L	H	L	Positive reference current value
L	L	H	Negative reference voltage value
L	H	H	Negative reference voltage value

## REFERENCE VOLTAGE SELECTOR [U7 (Z)]

Either the potential selected by [U8 (Y)] or the COM potential is selected and output to the Comparator. This selector is controlled by 1 digital signal (D16).

D16	Selected potential
L	[U8 (Y)] potential
H	COM potential

## ± REFERENCE VOLTAGE GENERATOR DAC (U6, U9, D7, R19 - R22, AND R69 - R71)

All reference voltages for the power source are generated here. U6 constitutes a 12 bit current adding type DAC. Current - to - voltage conversion is carried out in U9a and U19b, while negative potentials are generated in U9b. The digital signals used in DAC are D1 - D12. This DAC, however, can be used as a 14 bit DAC by simply adding 2 bits, digital signals D23 - D24 and through R69 - R71, on the LSB side.

## ± REFERENCE VOLTAGE GENERATOR DAC (U6, U9, D7, R19 - R22, AND R69 - R71)

All reference voltages for the power source are generated here. U6 constitutes a 12 bit current adding type DAC. Current - to - voltage conversion is carried out in U9a and U19b, while negative potentials are generated in U9b. The digital signals used in DAC are D1 - D12. This DAC, however, can be used as a 14 bit DAC by simply adding 2 bits, digital signals D23 - D21 and through R69 - R71, on the LSB side. The reference voltage for AMP U9a and U9b, used for ± voltage - voltage conversion, becomes generated by D7 and in R19 - R22.

Input digital signal	000H	3FFFH
Generated + Voltage TYP value	- 186 mV	+ 3.910V
Generated - Voltage TYP value	+ 186 mV	- 3.920V

## ± REFERENCE VOLTAGE SWITCH [U7 (X)]

Either the ± reference voltage output from U9a or that output from U9b is selected and input into the following Reference Voltage Switch [U7 (X)].

This switch is controlled by 1 digital signal (D14).

D14	Selected potential
L	Positive reference voltage
H	Negative reference voltage

## REFERENCE VOLTAGE SWITCH [U7 (Y)]

A signal from [U7 (Y)] is input to either the comparator or the next Reference Voltage Switch [U8 (X)] depending on the selection made.

This switch is controlled by 1 digital signal (D15).

D15	Where signal is sent
L	Comparator
H	U8 (X)

## REFERENCE VOLTAGE SWITCH [U8 (X)]

A signal from [U7 (Y)] is input to either to the four ± Reference Voltage Generators V or to Reference Voltage Generator A.

The signal that controls this switch is the same signal that controls the Reference Voltage Selector [U8 (Y)].

D17	D19	D20	Conducting condition & where signal is sent
H	—	—	Non-conducting condition
L	L	L	Positive Reference Voltage Generator V
L	H	L	Positive Reference Voltage Generator A
L	L	H	Negative Reference Voltage Generator V
L	H	H	Negative Reference Voltage Generator A

# CIRCUIT DESCRIPTION

## COMPARATOR (U14)

A comparison is made on the potentials of signals sent from [U7 (Y)] and [U7 (Z)] . Data decided from the comparison is then sent to the CPU via the Signal Converter. Overall speaking, data is output following successive comparison.

Contents of decided data	Signal from [U7 (Y)]	Signal from [U7 (Z)]
Detection of positive reference voltage OV data	Positive reference voltage	COM
Detection of negative reference voltage OV data	Negative reference voltage	COM
Detection of positive output voltage values	Positive reference voltage	Voltage Divider (R35)
Detection of negative output voltage values	Negative reference voltage	Voltage Divider (R37)
	Negative reference voltage	Voltage Divider (VR3 and R55)
	Positive reference voltage	Voltage Divider (VR4 and R56)

In order to minimize offset error in U14a, U14b is used as a buffer and offset error is overall canceled in U4.

## SIGNAL CONVERTER (U17a, D18, R59 - R63)

The  $\pm 12$  V signals sent from U14 are converted to  $\pm 5$  V signals in D18 and R59 - R60. These signals get a 0.25 V hysteresis, with 2.5 V as the center, by U17a, R61, and R62. They are then sent to the CPU.

## DATA LATCH (U3 - U5)

The 24 bit data sent to the serial from the CPU are serial parallel converted and output as 24 bit data. The following 3 type of data (D13, D21, and D22) have not been explained so far so please take note.

### D13:

This data becomes "H" only when a reset is made on voltage generated by  $\pm$ Reference Voltage Generators.

### D21:

This data is used for controlling the Positive AC Power Drive.

This data becomes "H" when the positive output voltage is above 10.40 V. (PWR 18-2)

This data becomes "L" when the positive output voltage is below 10.40 V. (PWR 18-2)

This data becomes "H" when the positive output voltage is above 20.34 V. (PWR 36-1)

This data becomes "L" when the positive output voltage is below 20.34 V. (PWR 36-1)

### D22:

This data is used for controlling the Negative AC Power Drive.

This data becomes "H" when the negative output voltage is below -10.40 V. (PWR 18-2)

This data becomes "L" when the negative output voltage is above -10.40 V. (PWR 18-2)

This data becomes "H" when the negative output voltage is below -20.34 V. (PWR 36-1)

This data becomes "L" when the negative output voltage is above -20.34 V. (PWR 36-1)

The above data get a  $|1.0|$  V hysteresis, with  $|10.40|$  V as the center, at PWR 18-2. In case of PWR 36-1, they get a  $|1.0|$  V hysteresis with  $|20.34|$  V as the center.

## ISOLATOR AND +5 V GENERATOR

The CPU and the AMP are electrically isolated and signals between them are transmitted using photo couplers in U103 and U105.

The power source on the CPU side is +5V generated in D101, C101, and U101.

## NOISE SUPPRESSOR

In an effort to prevent noise, the CPU and Panel are equipped inside with a shielded case. There is some noise, however, that passes through the line of signal transmission

## CPU

U4 - 64 Waveform, CPU Clock Waveform

By attaching X'tal oscillator X1, C3 and C4 to pins 2 and 3 of U4, U4 can be operated at half the frequency.

# CIRCUIT DESCRIPTION

## KEYBOARD INPUT, ROTARY ENCODER INPUT, INPUT PORT, AND INTERRUPT

When any of the keys (S51 - S63) are, pressed, the output of U55 becomes "L" and the CPU is interrupted. The pressed key is decided by signals (2 lines) from Output Port U53 and from Input Port U54. When the rotary encoder is operated, the collector potential of either Q62 or Q63 becomes "L", i.e. passing through the sequence U57e → U57f → U56, and this potential interrupts the CPU. The Rotary Encoder counts within a given time pass through U57a and U57b, and is input into the CPU via Input Port U7. As for the up/down decision of the encoder, data sent to the CPU via Input Port U7 is decided. This is because the  $\bar{Q}$  output of U56a and U56b falls to "L", when data from the encoder first interrupts the CPU, and this state is maintained. Besides data from the keyboard or the rotary encoder, 3 types of data from the AMP and isolator are input into the Input Port U7 and U10. These data are different from those for the previously mentioned interrupt input. They are periodically read out by the CPU within the program loop, reaching the CPU via the Input Port U7 and U10.

Details of the said data are as a following:

- (1) Comparative U14 data (Successive comparison data)
- (2) Positive output data (CC state at "L")
- (3) Negative output data (CC state at "L")

## OUTPUT PORT

- The 2 pieces of data at Output Port U53 are normally "H". As previously mentioned, pressing any key (S51 - S63) turns either of the above data to "L" while the other remains "H". After data of the opposite nature is output, the key input becomes a decided.

- 4 pieces of data at Output Port U53 are used as control signals for the Display Drive.
- 3 pieces of data are sent to the AMP digital data generator from Output Port U53 via the Isolator.

The above data are as the following:

- (1) 24 bit serial data
- (2) 24 bit serial data shift clock data
- (3) 24 bit serial data latch clock data

They are then sent to the digital data generator via the isolator. This action also compensates for any lag in the response time of the isolator's photo coupler.

## DISPLAY DRIVE AND DISPLAY

Both U51 and U52 are ICs for dynamic blinking lights. Transmitters (R83 and C60, R84 and C61, respectively) are equipped. The display is controlled by the previously mentioned 4 pieces of data from U53.

## Buffer Unit (X81-2890-00)

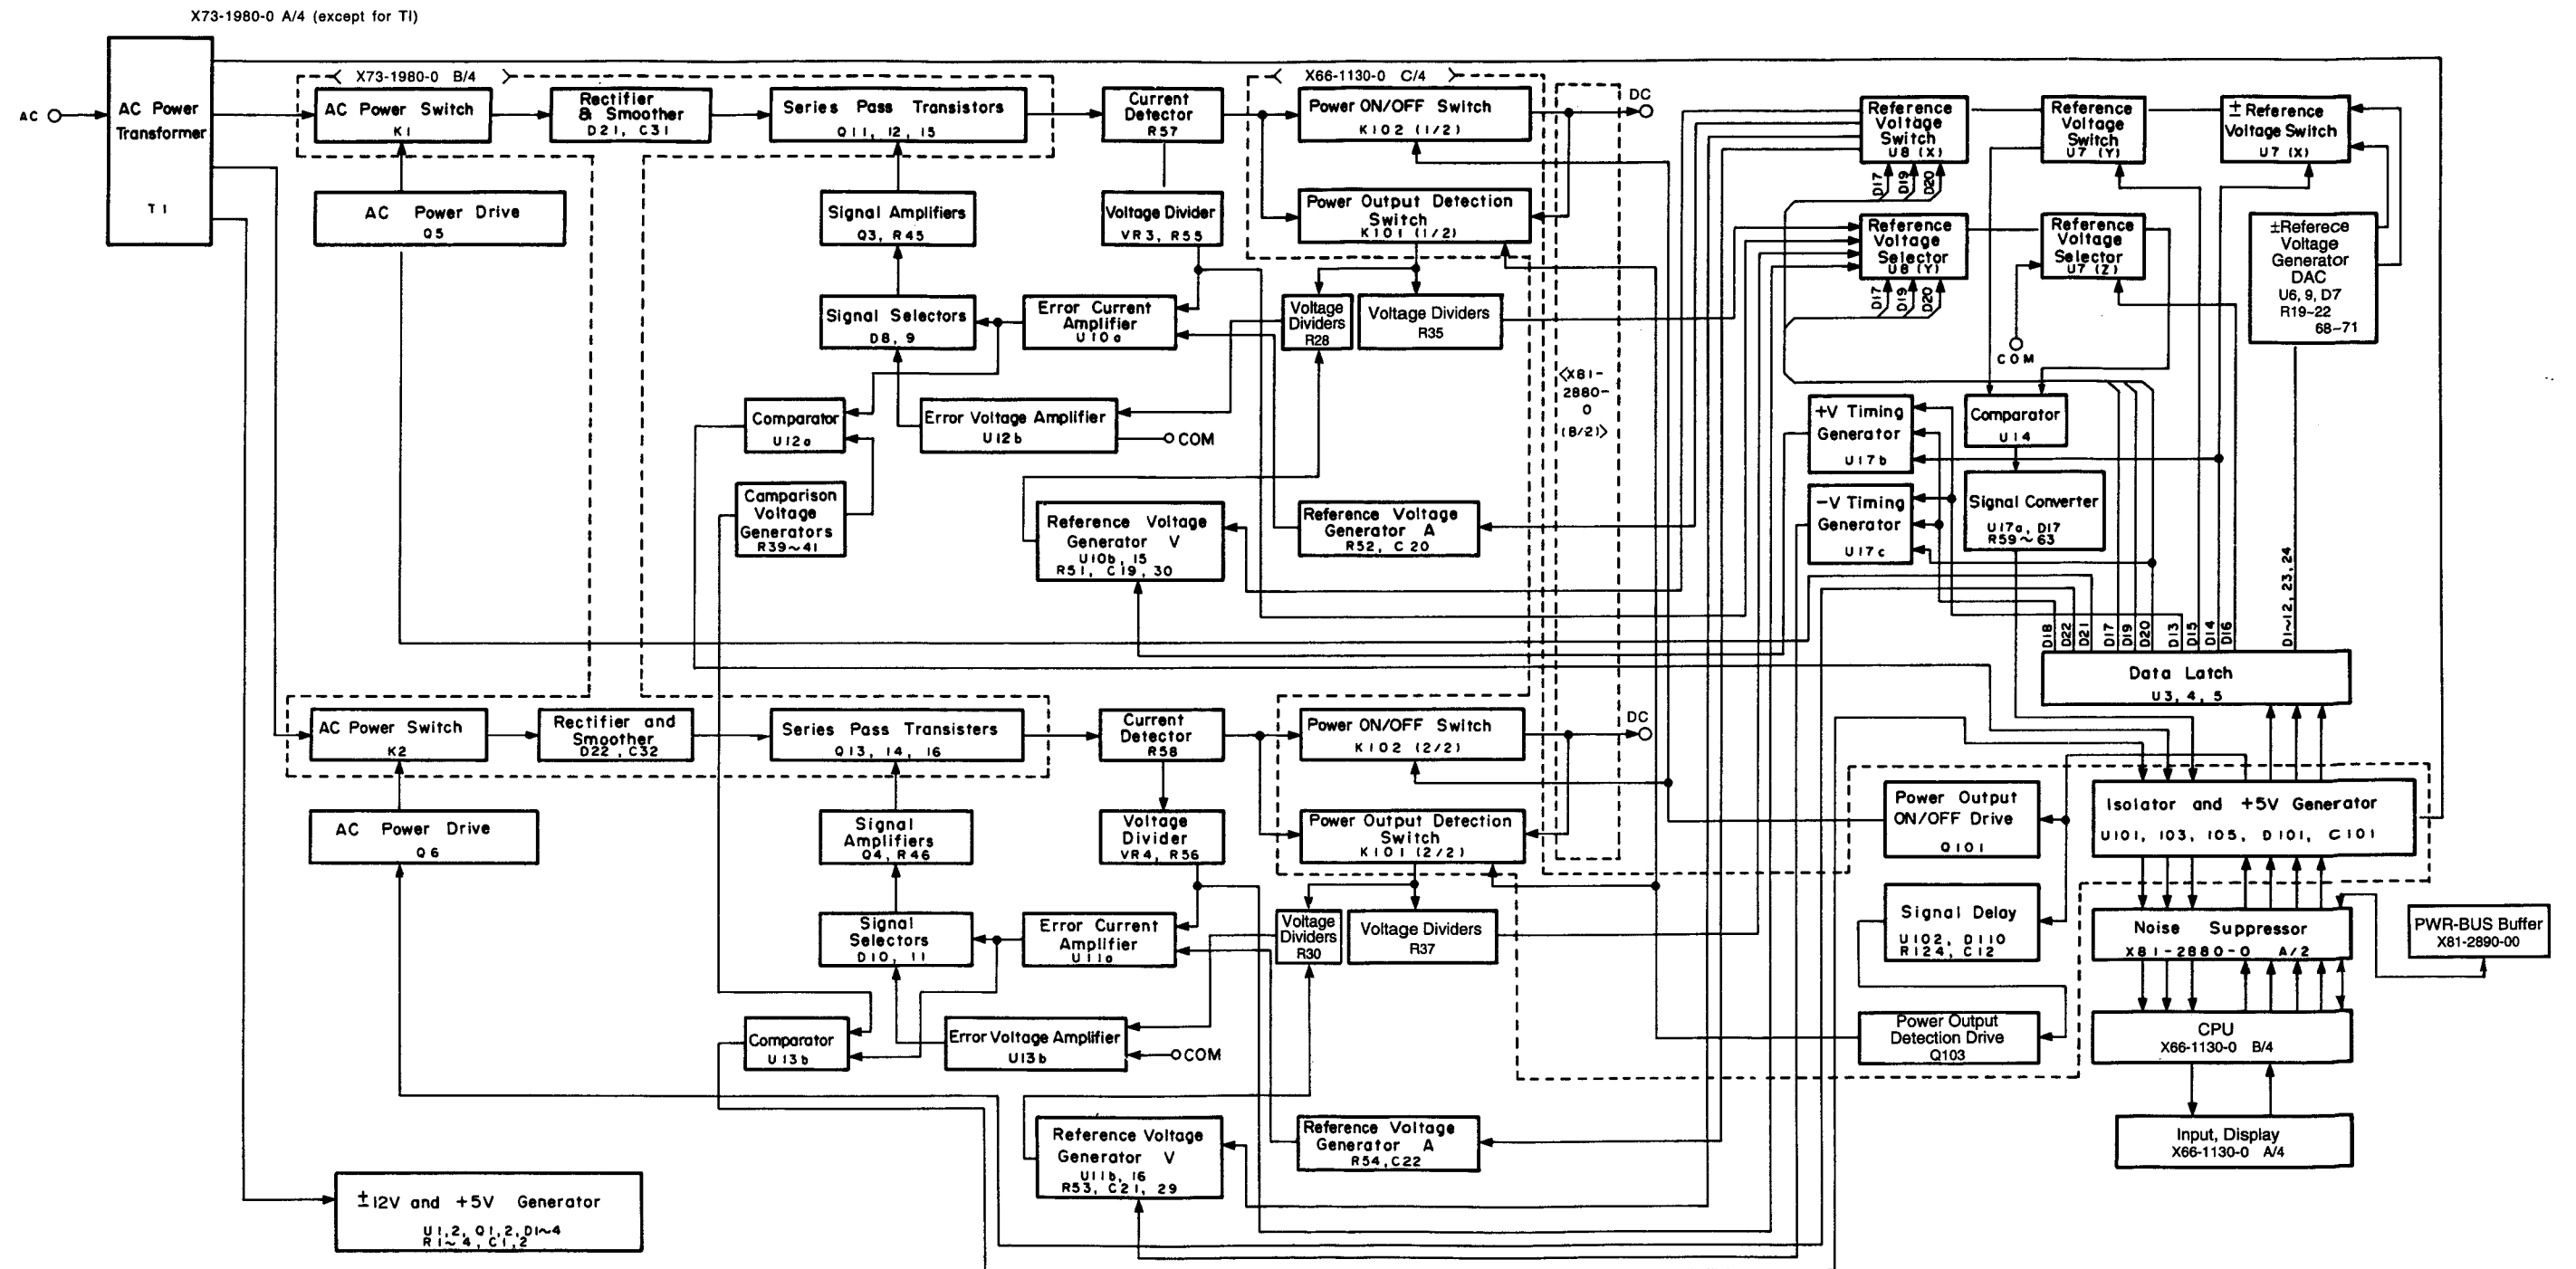

Waveforms at various points when the "ST" command is sent from the PC

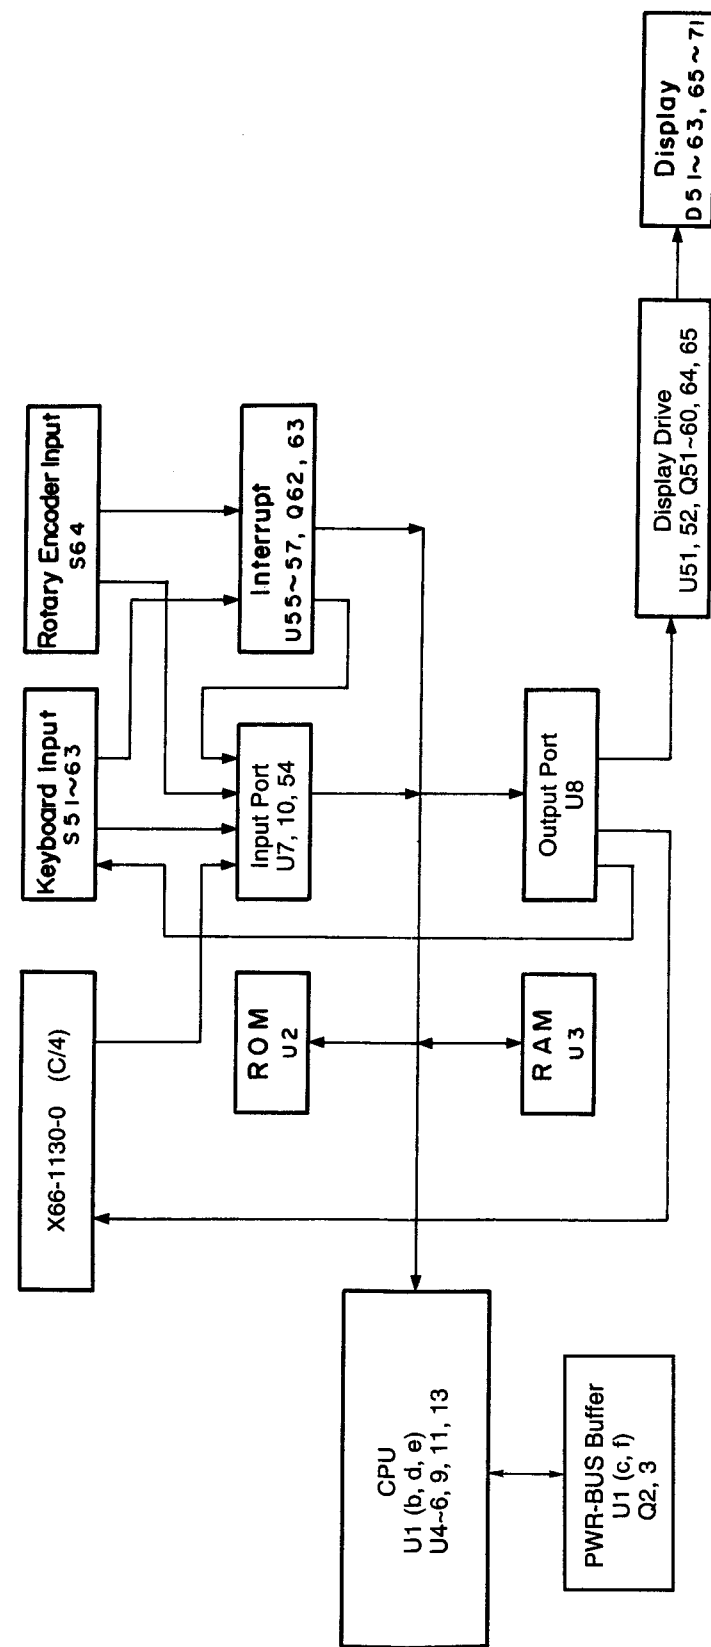

This unit converts the RS-232C signal level into the PWR-BUS signal level. The level of the RS-232C signal input through pin 5 of P2-IN is converted by U1 and Q1 into the PWR-BUS signal level, and this signal is sent inside the set through pin 5 of P1.

The PWR-BUS signal sent from inside the set is sent to U1 through pin 5 of P1, its level is converted by U1 into the RS-232C signal level, and this signal is output externally through pin 2 of P2-IN. At the same time, the PWR-BUS signal is also output externally through pin 3 of P2-IN and pin 3 of P2-OUT.

BLOCK DIAGRAM

ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.

The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available, contact your dealer. For optimum adjustment, turn the power on and warm up the scope sufficiently (more than 30 minutes) before starting.

Before calibrating the unit, check the power supply voltage.

TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustment.

Multimeter	45	FLUKE
Oscilloscope	CS-5025	KENWOOD

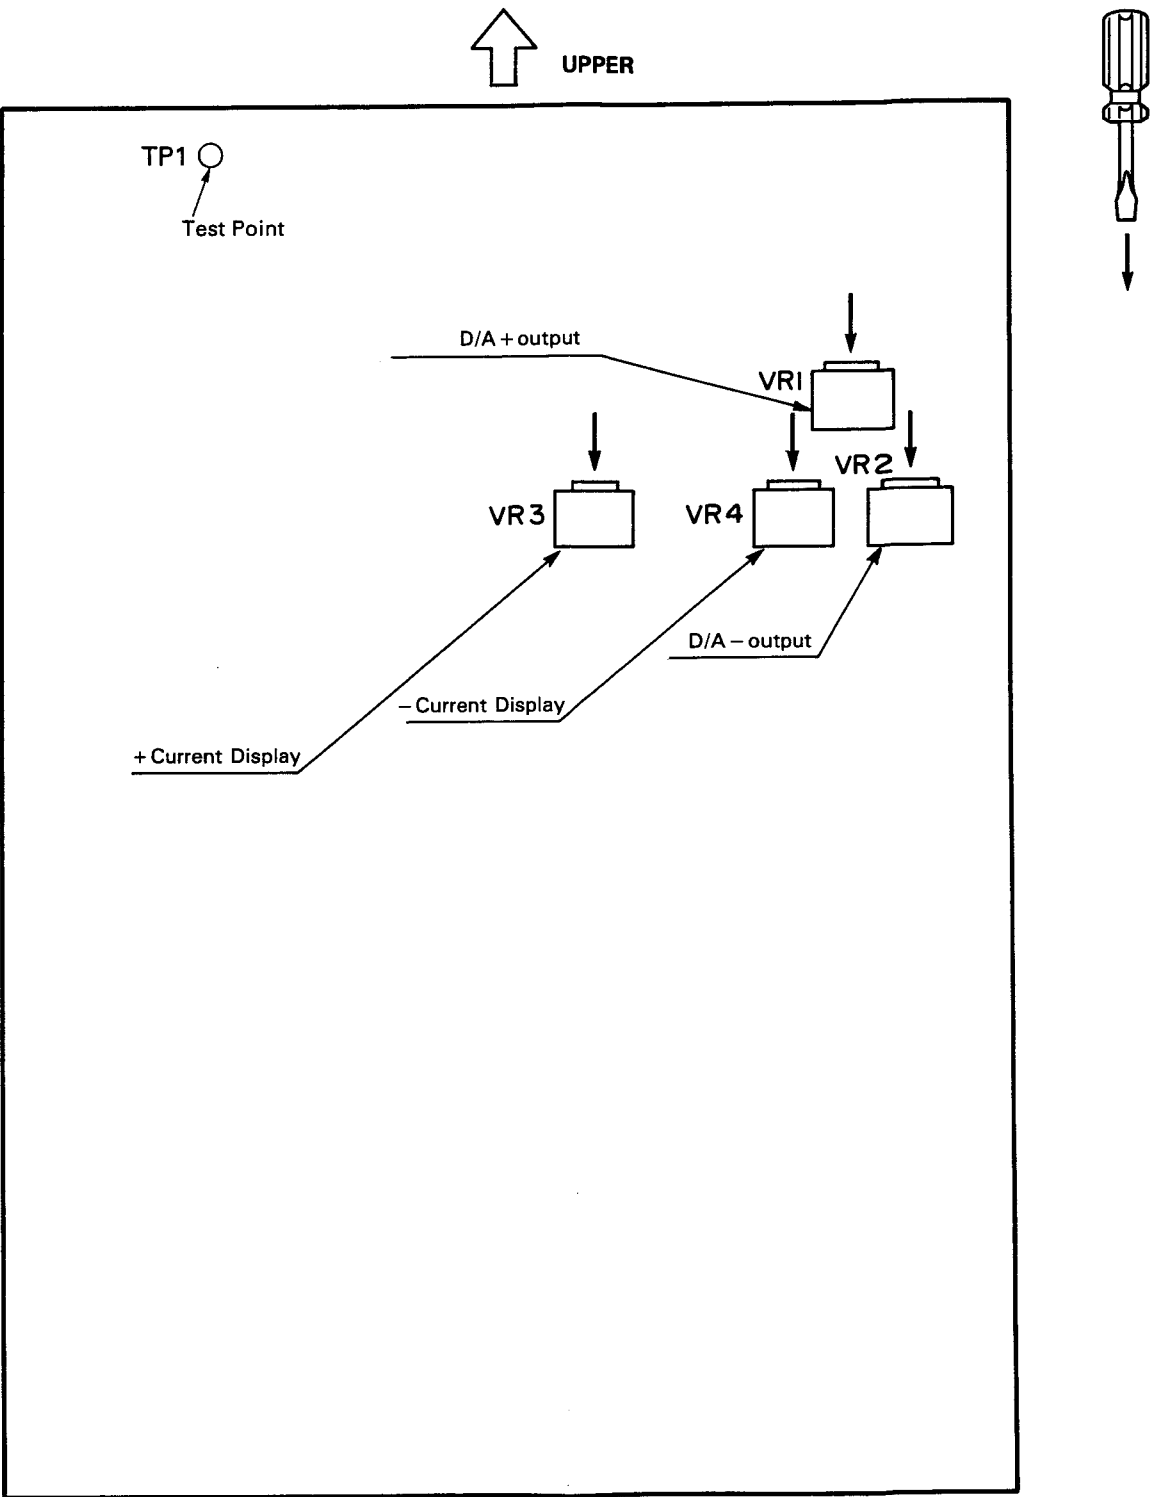

ADJUSTMENT

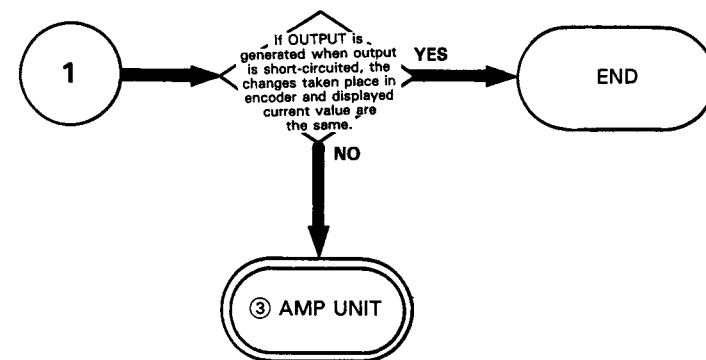

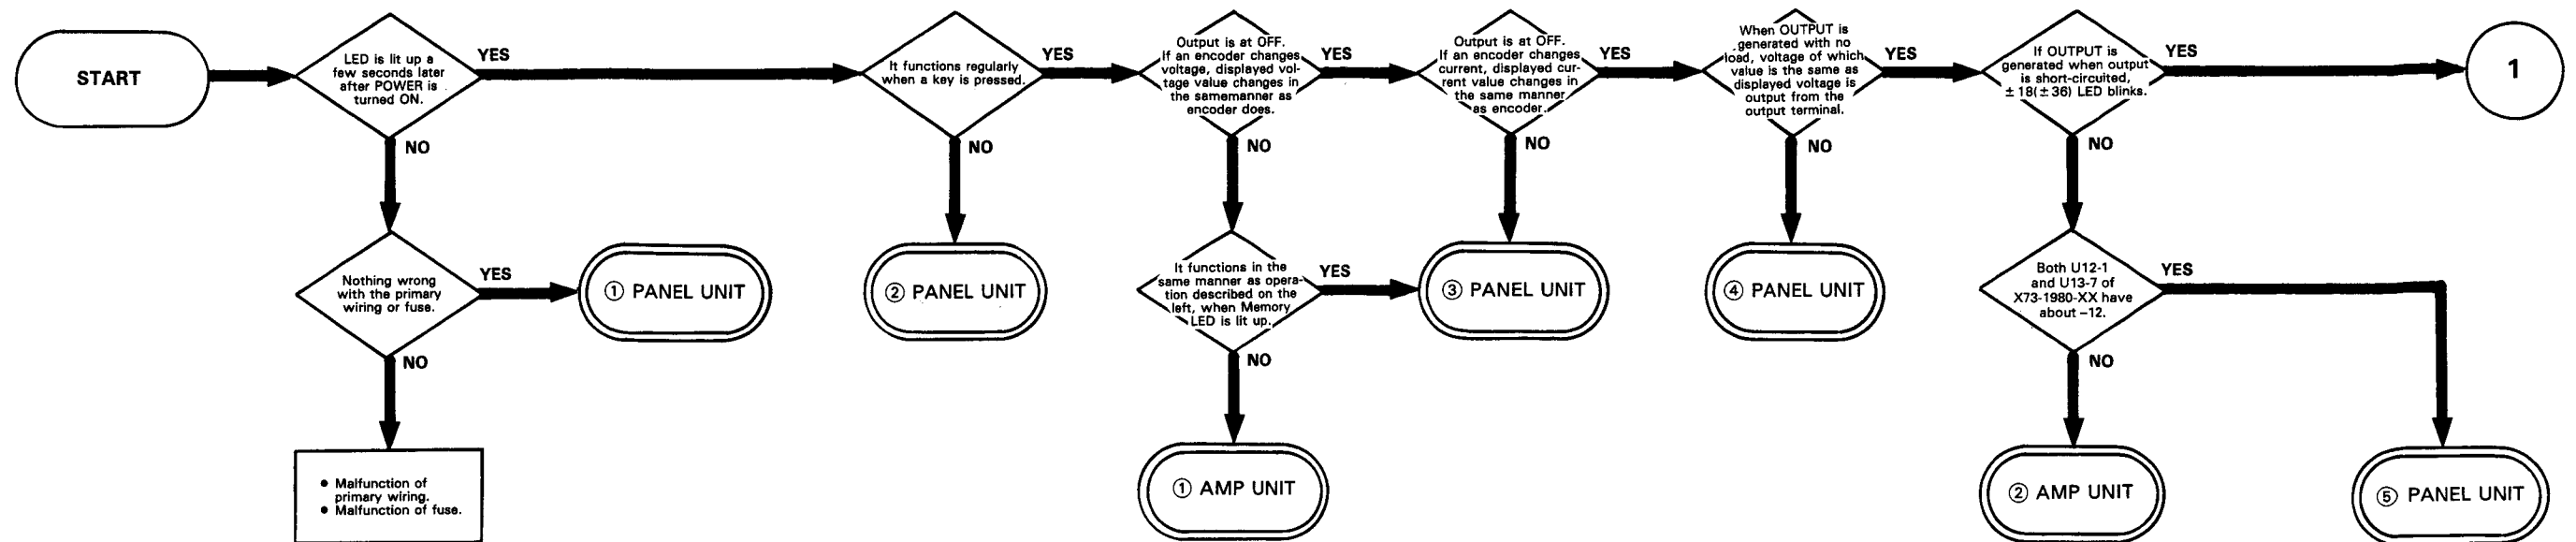

Note: The values inside ( ) are those with the PWR36-1.

Item	Adjustment VR	Procedure
D/A + Output	VR1	<div>1. Connect the multimeter as follows: Multimeter PWR + to X73-1980 TP COM to COM terminal on the panel At this point, set the multimeter to the voltage measurement mode.</div> <div>2. Set the PW to the voltage adjustment mode. Turn the power switch ON pressing the KEYLOCK switch. Set the KEYLOCK switch free when the LEDs go on. At this point, all the 7-segment LEDs display "8".</div> <div>3. Press the PRESET1 and observe the multimeter. Assume that the value at this point is P.</div> <div>4. Press the PRESET2. Then adjust the VR1 so that the multimeter indicates <math>(P + 4.096) \text{ V}</math>. <math>\pm 2\text{mV}</math></div>
D/A - Output	VR2	<div>1. Press the PRESET3 and observe the multimeter. Assume that the value at this point is N.</div> <div>2. Press the VARIABLE. Then adjust the VR2 so that the multimeter indicates <math>(N + 4.096) \text{ V}</math>. <math>\pm 2\text{mV}</math>.</div> <div>3. Cancel the voltage adjustment mode by pressing the V switch. (Cancellation will take about 10 seconds.)</div>
+ Current Display	VR3	<div>1. Connect the multimeter as follows: Multimeter PWR + to + 18 V (+ 36 V) terminal on the panel COM to COM terminal on the panel At this point, set the multimeter to the current measurement mode.</div> <div>2. Turn the OUTPUT switch ON. Then adjust the multimeter by turning the rotary knob so that it indicates 2.00 A (1.00 A). At this point, make sure that the + 18 V (+ 36 V) LED blinks and the unit maintains a constant current.</div> <div>3. Adjust the VR3 so that the multimeter indicates 2.00 A (1.00 A).</div>
- Current Display	VR4	<div>1. Connect the multimeter as follows: Multimeter PWR + to - 18 V (- 36 V) terminal on the panel COM to COM terminal on the panel At this point, set the multimeter to the current measurement mode.</div> <div>2. Display - 18 V (- 36 V) on the 7-segment LED by pressing the - 18 V (- 36 V) switch.</div> <div>3. Turn the OUTPUT switch ON. Then adjust the multimeter by turning the rotary knob so that it indicates - 2.00 A (- 1.00 A). At this point, make sure that the - 18 V (- 36 V) LED blinks and the unit maintains a constant current.</div> <div>4. Adjust the VR4 so that the multimeter indicates - 2.00 A (- 1.00 A).</div>

ADJUSTMENT

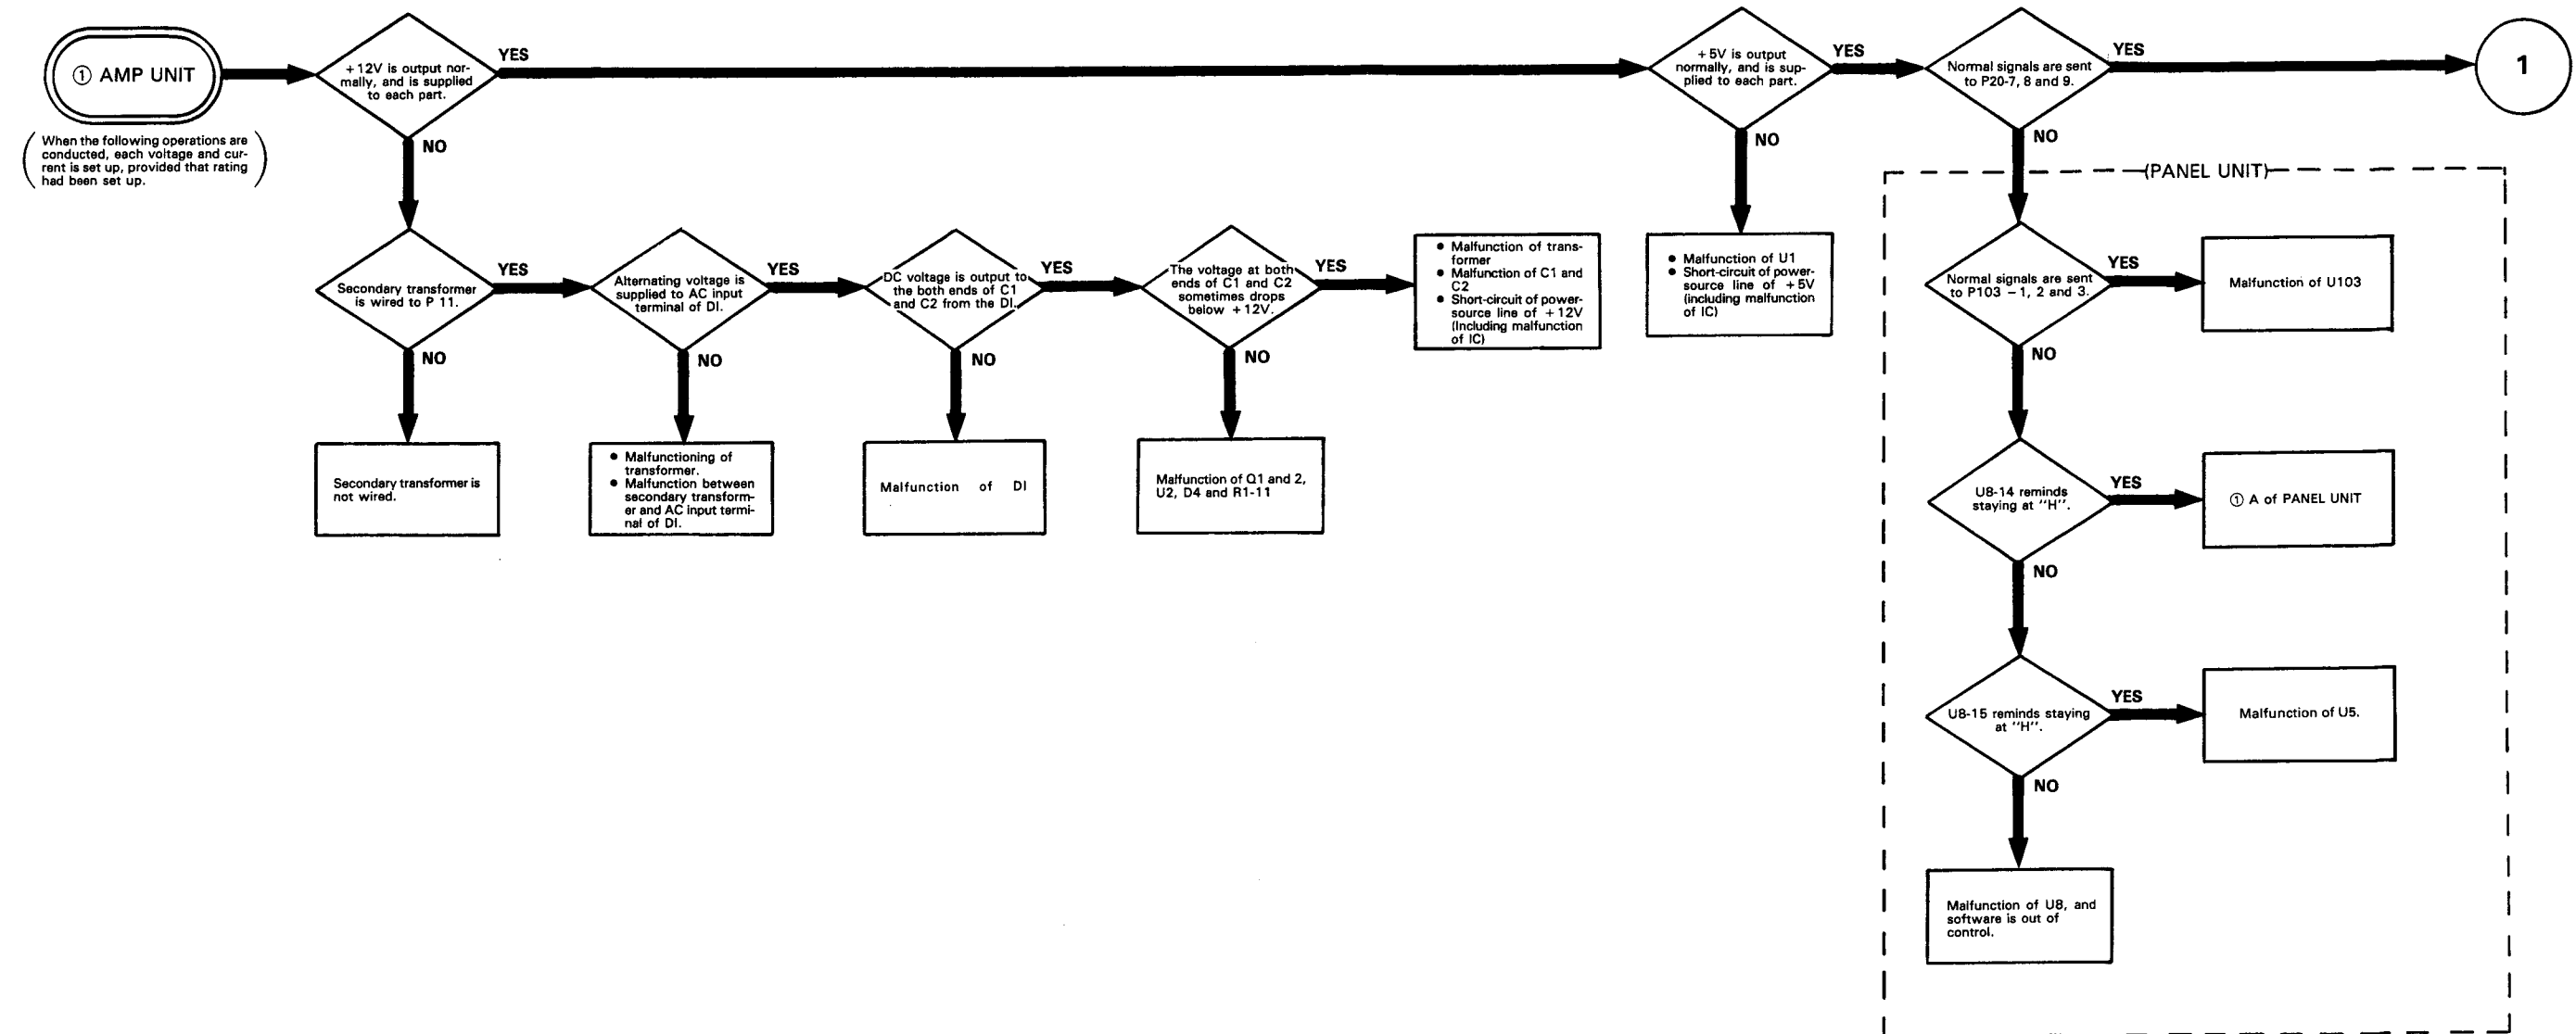

## TROUBLESHOOTING

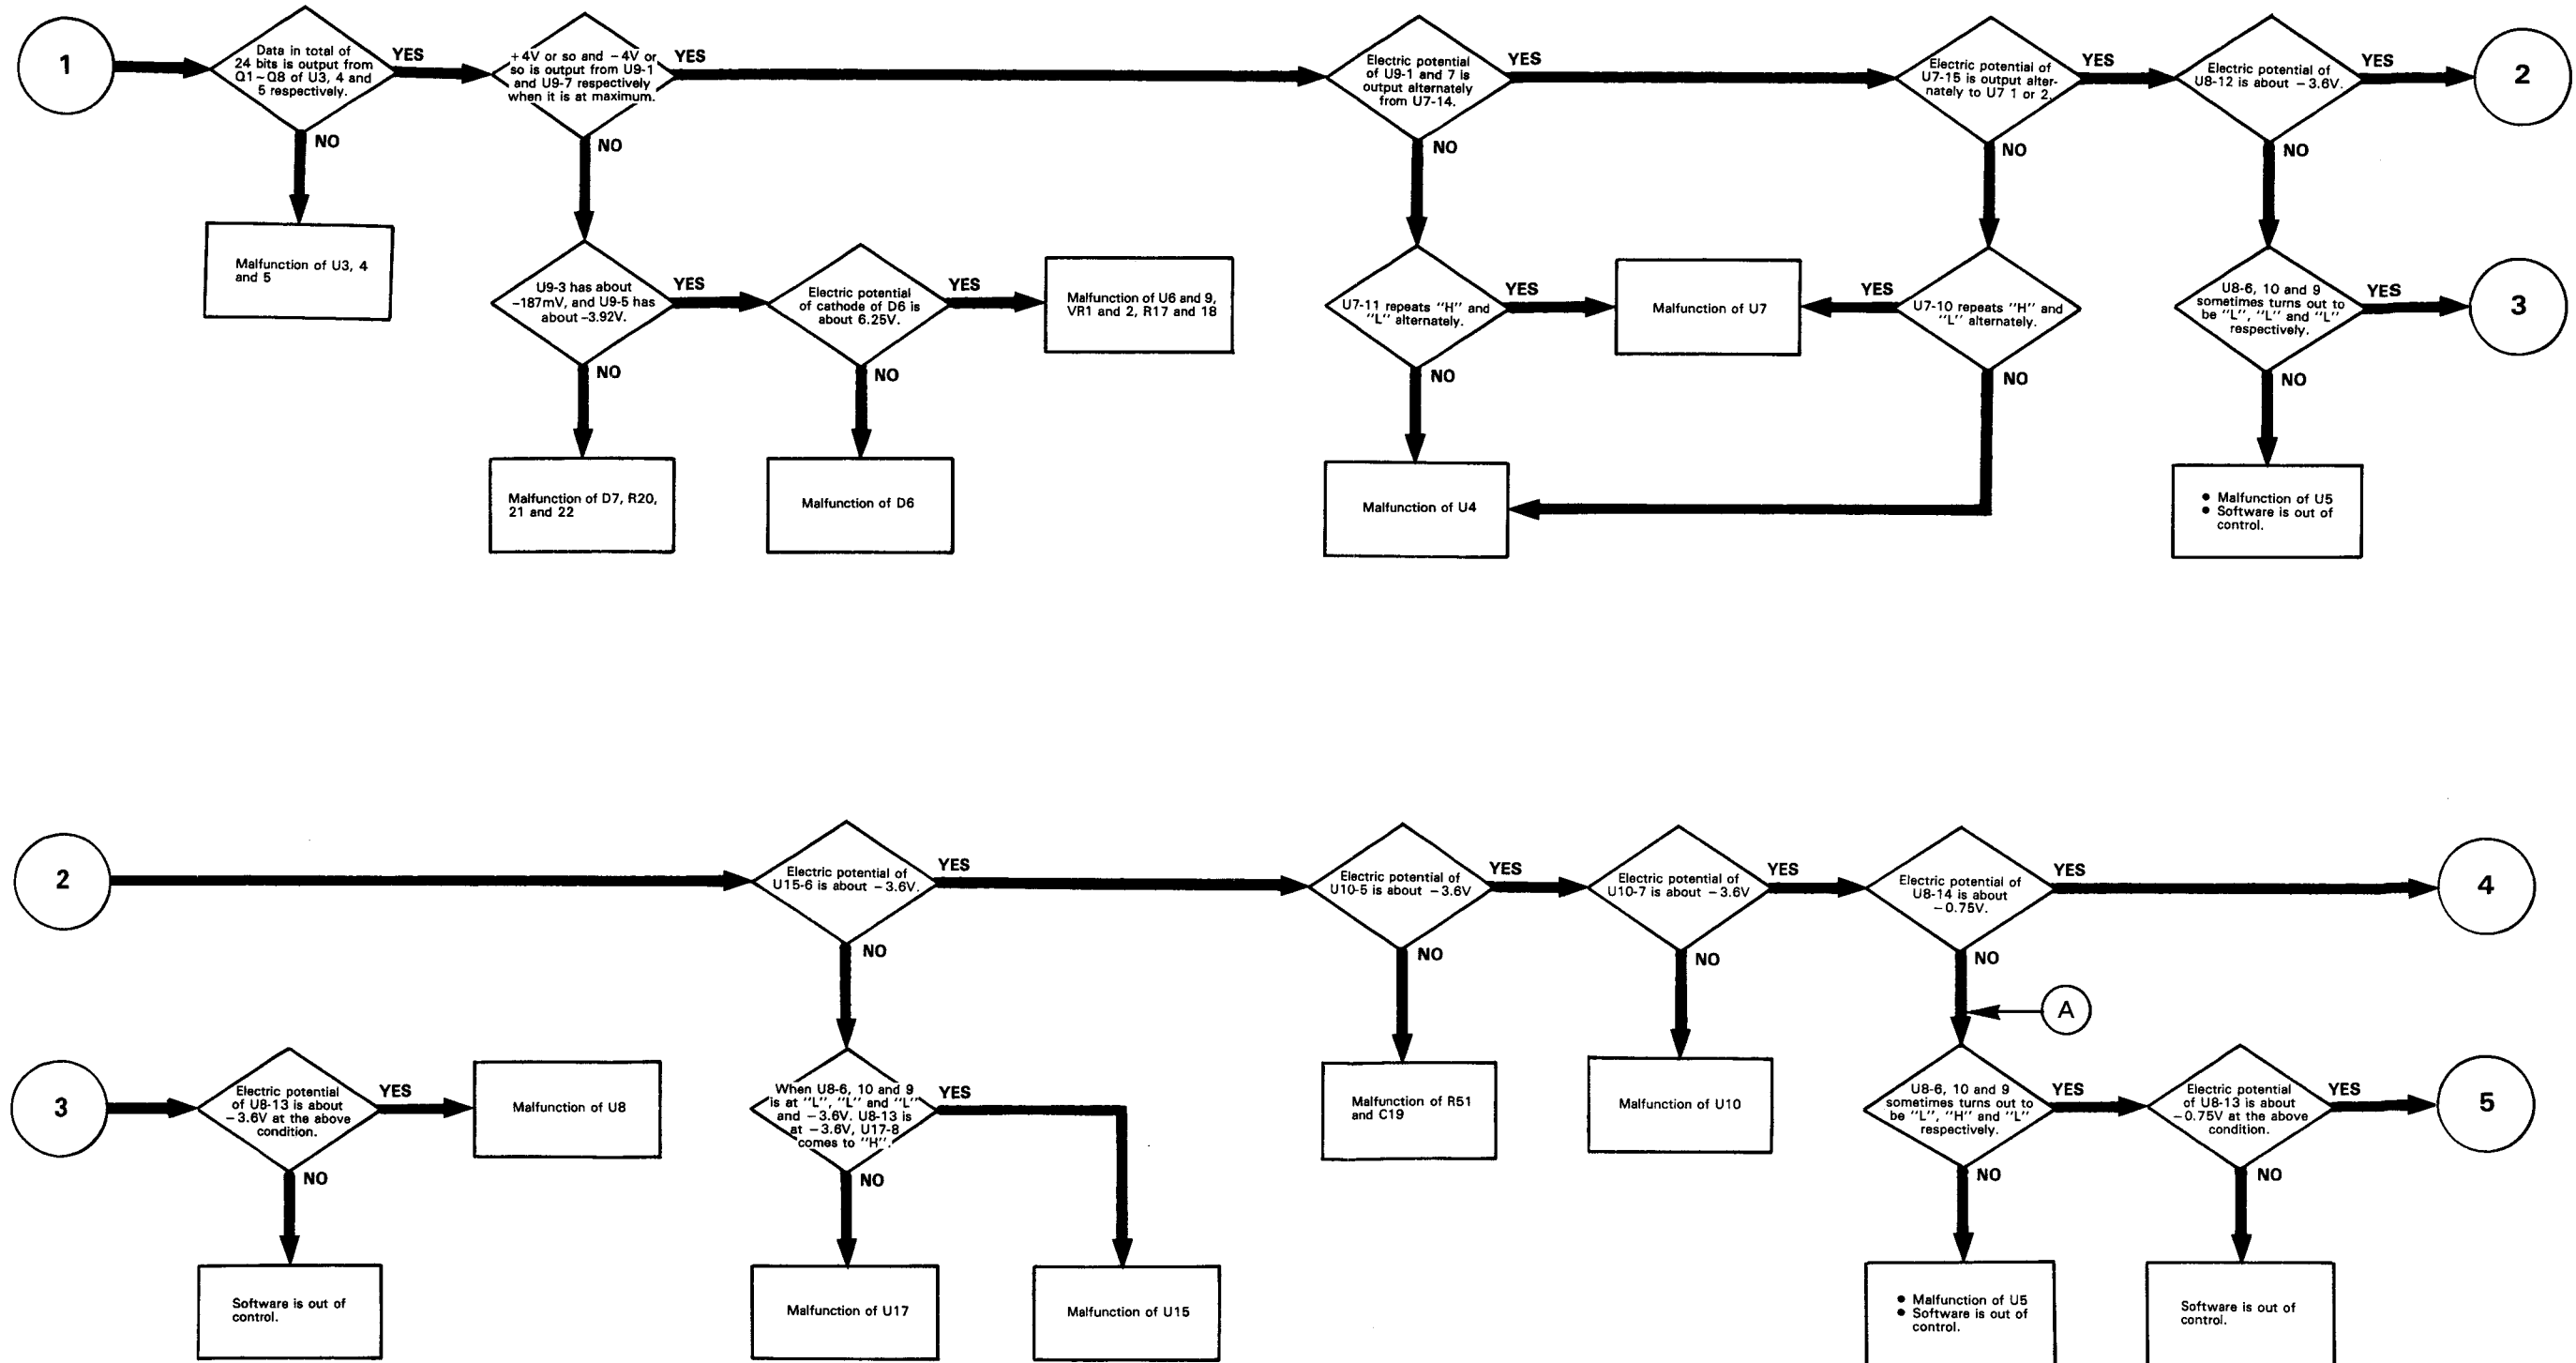

# TROUBLESHOOTING

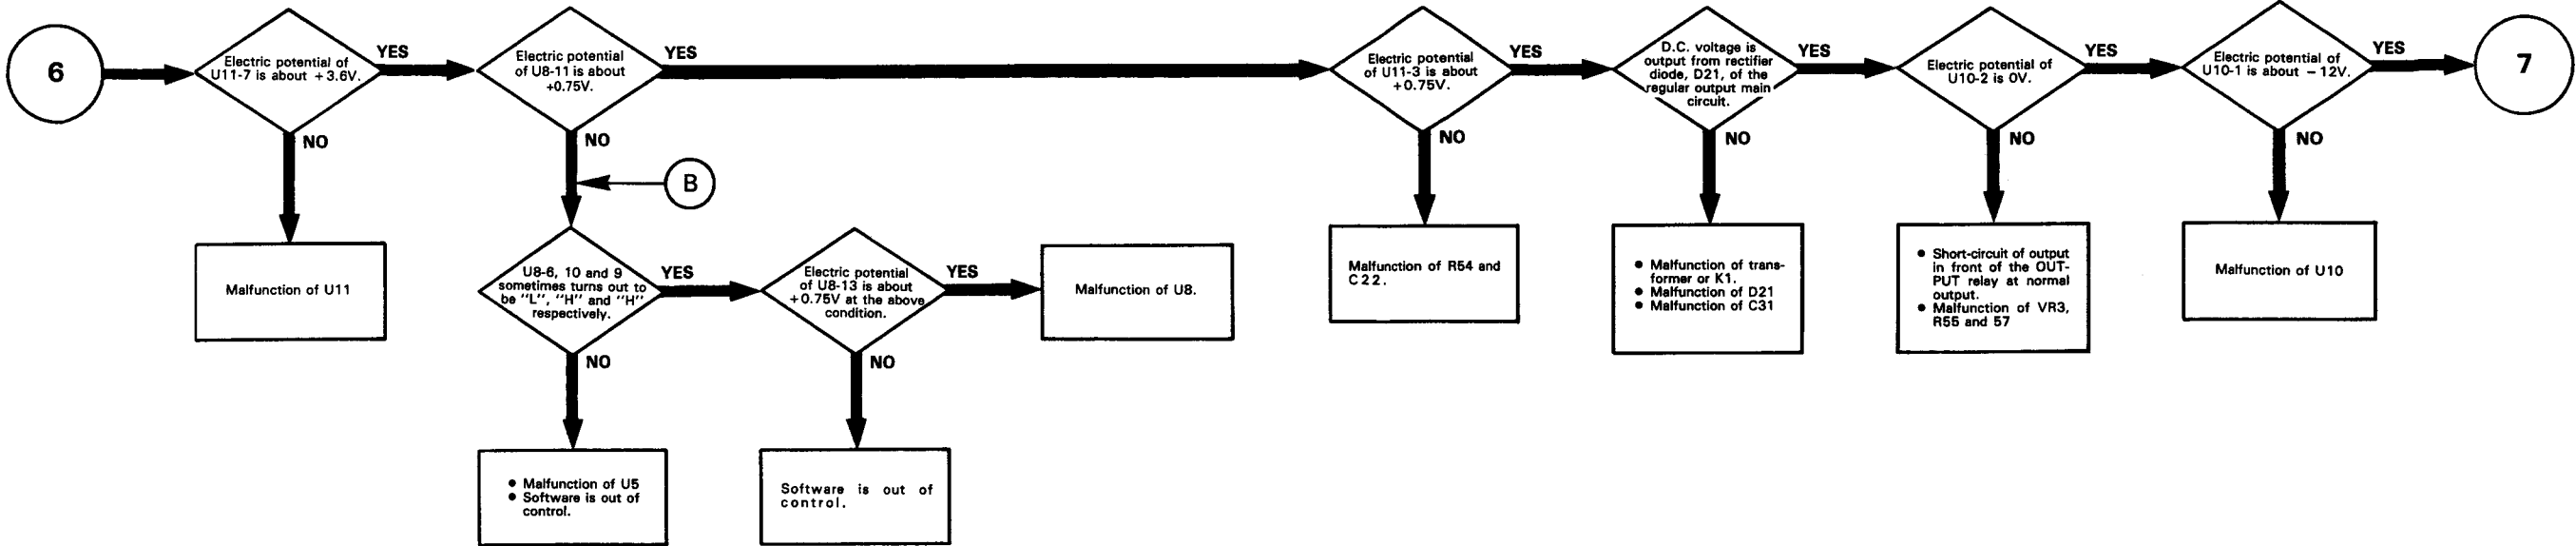

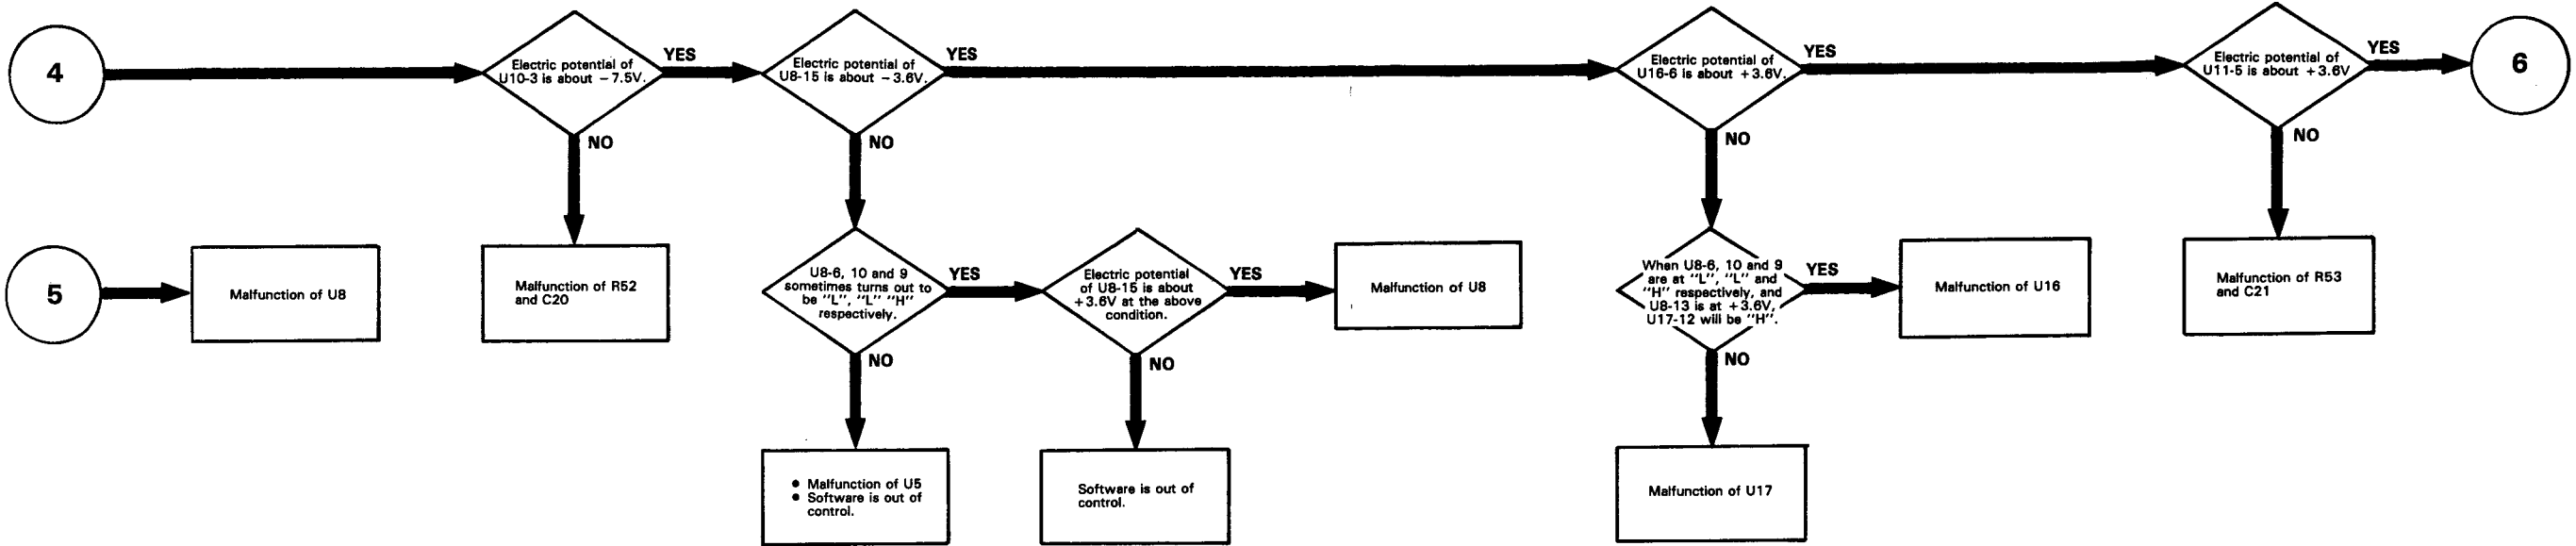

Symptom: When the voltage is varied with the encoder while the OUTPUT is OFF and MEMORY LED is not lit, the indicated voltage does not vary in accordance with the encoder operation.

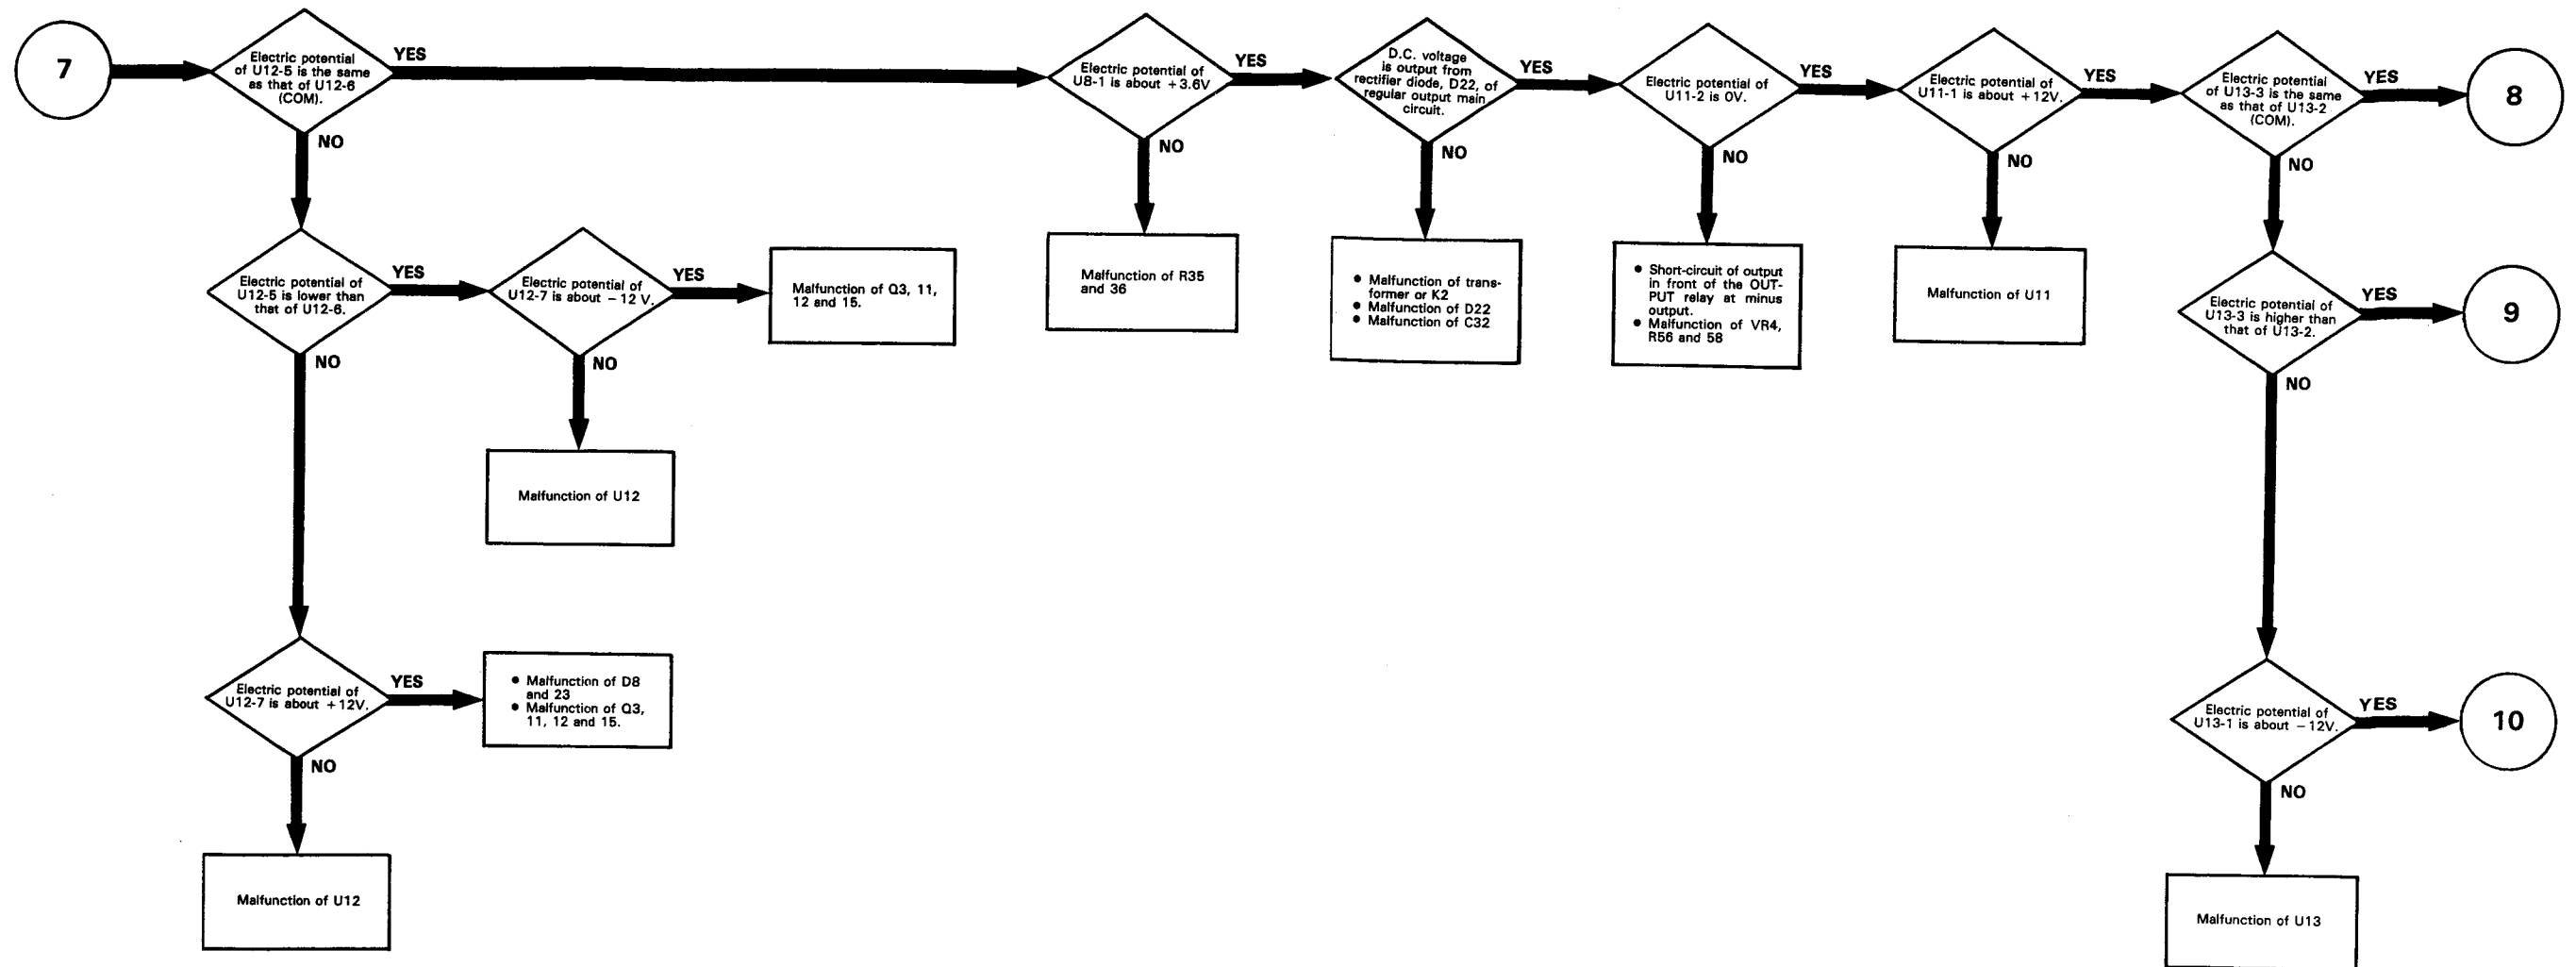

# TROUBLESHOOTING

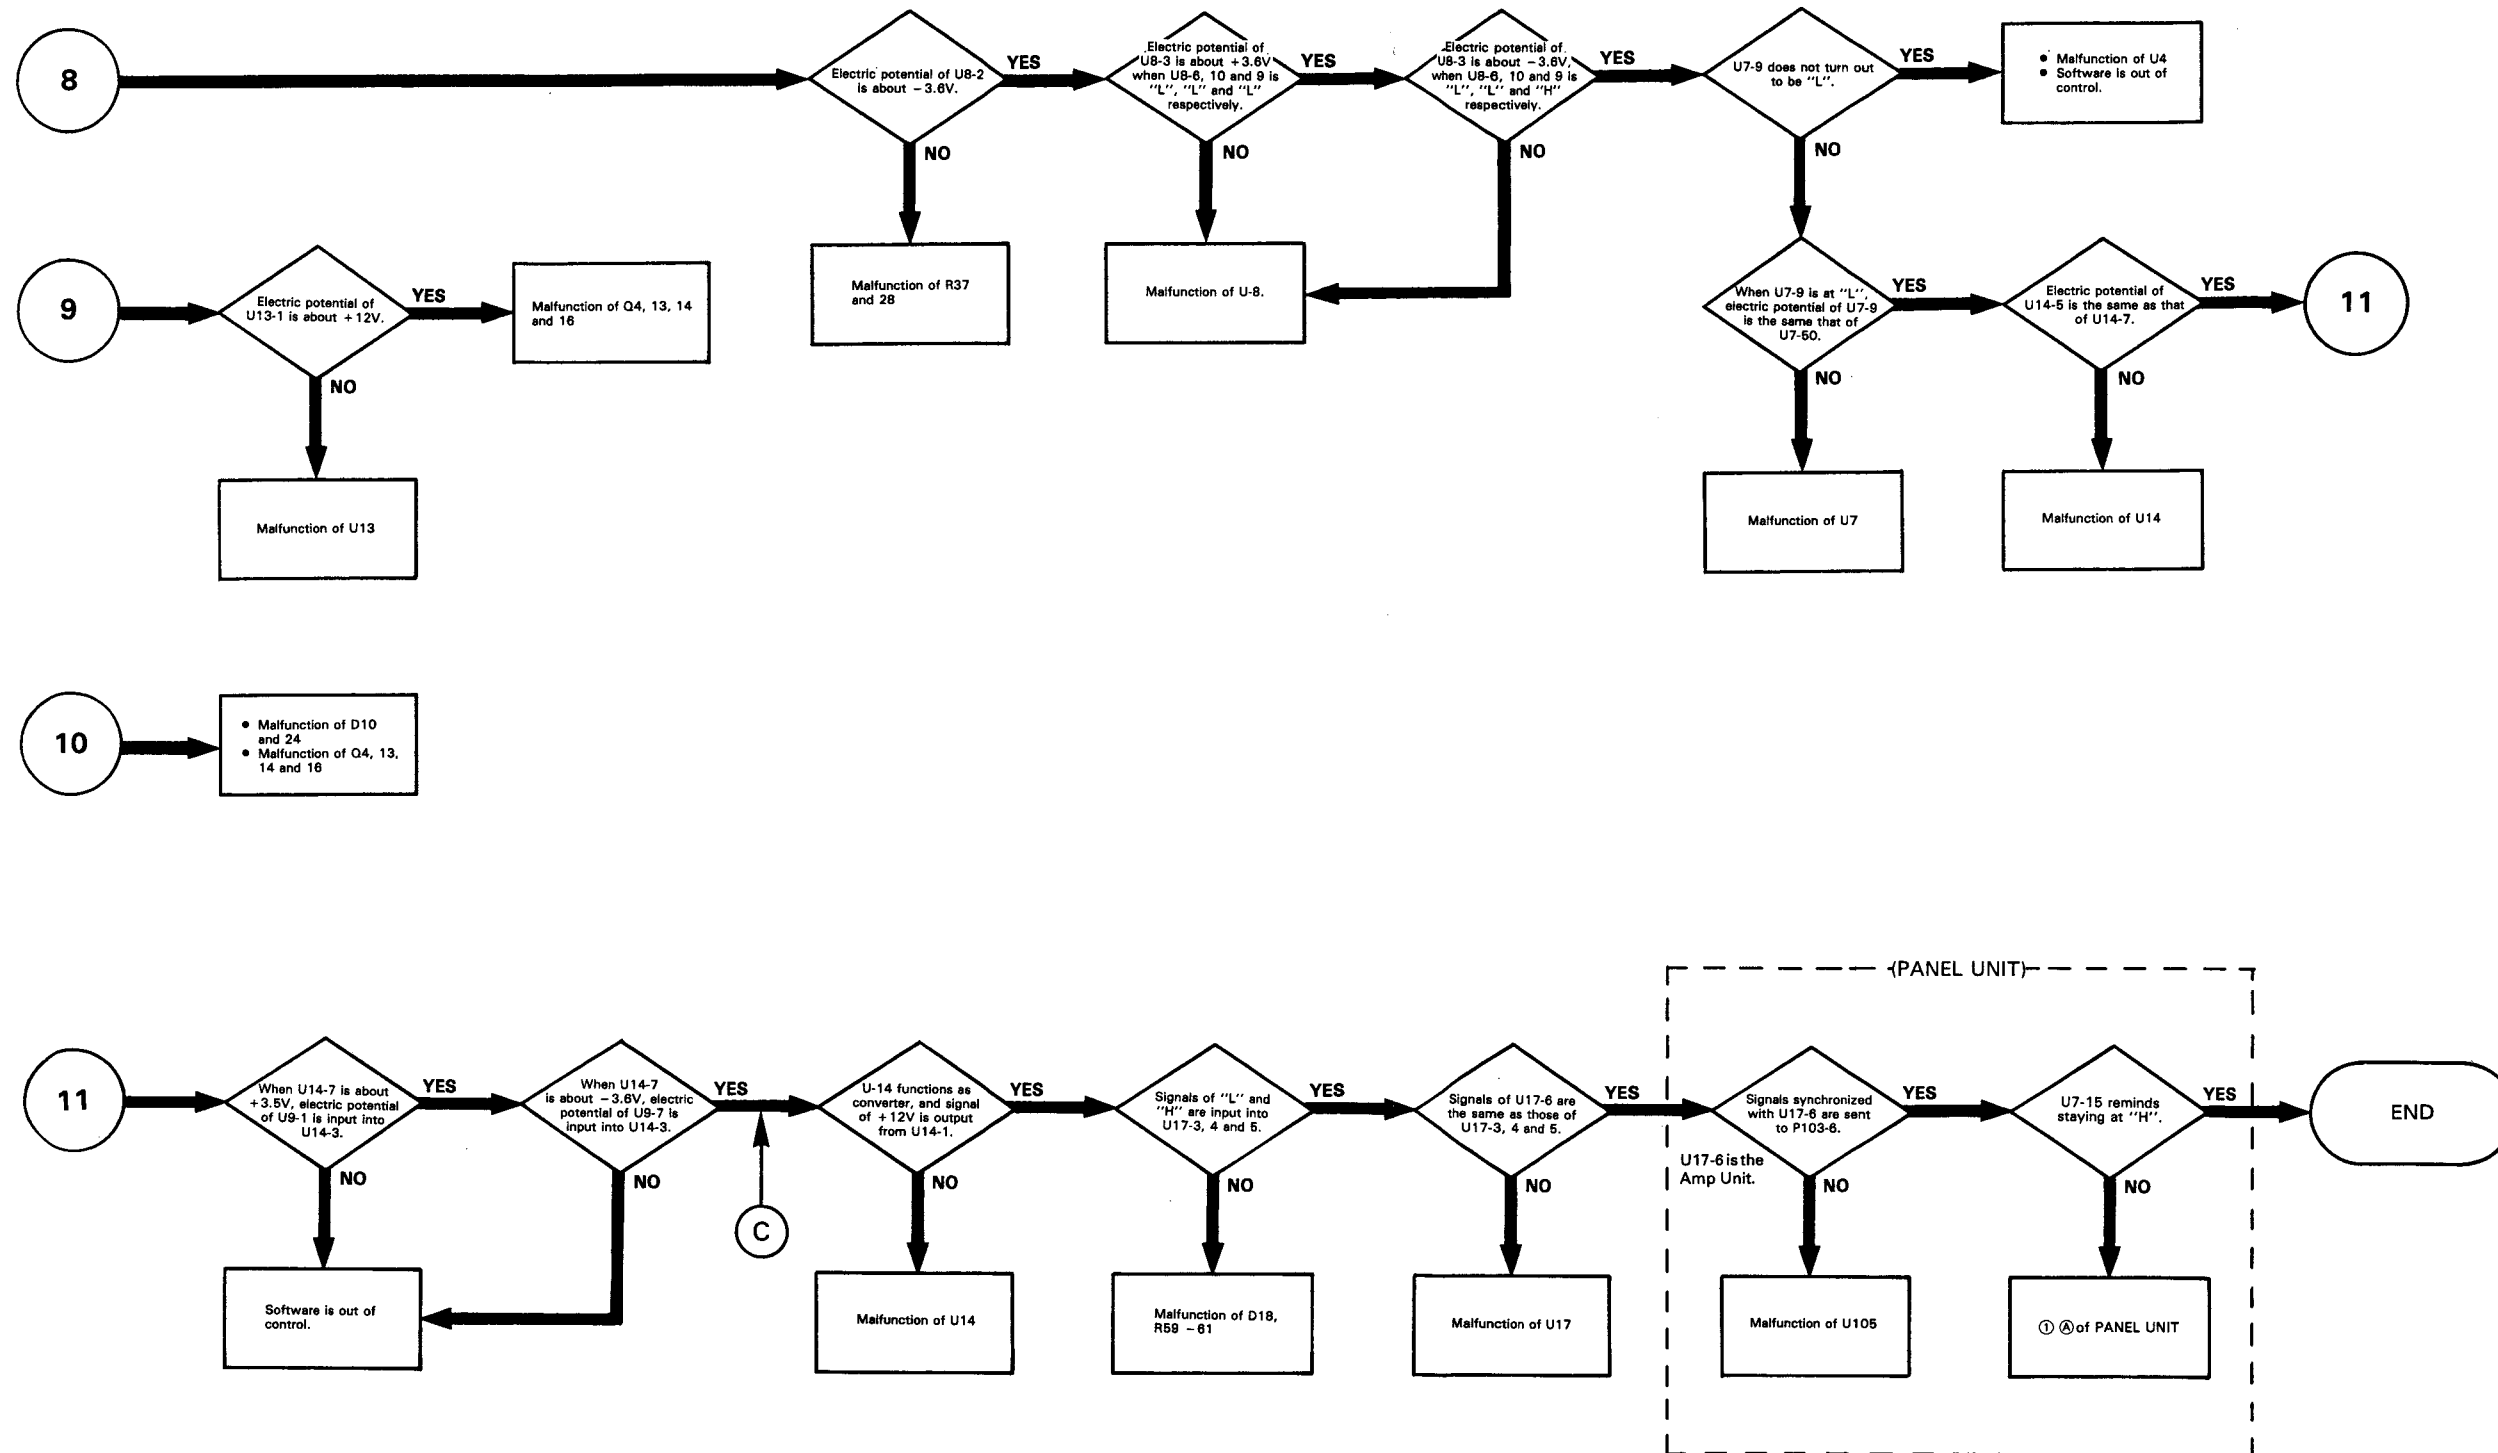

TROUBLESHOOTING

# TROUBLESHOOTING

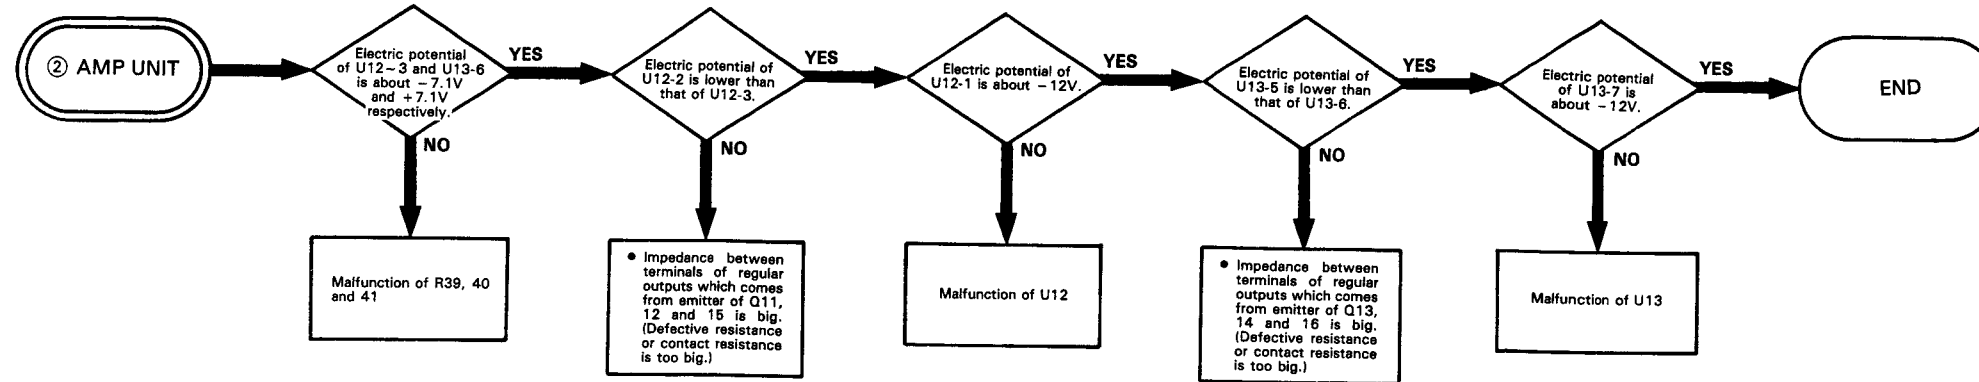

# TROUBLESHOOTING

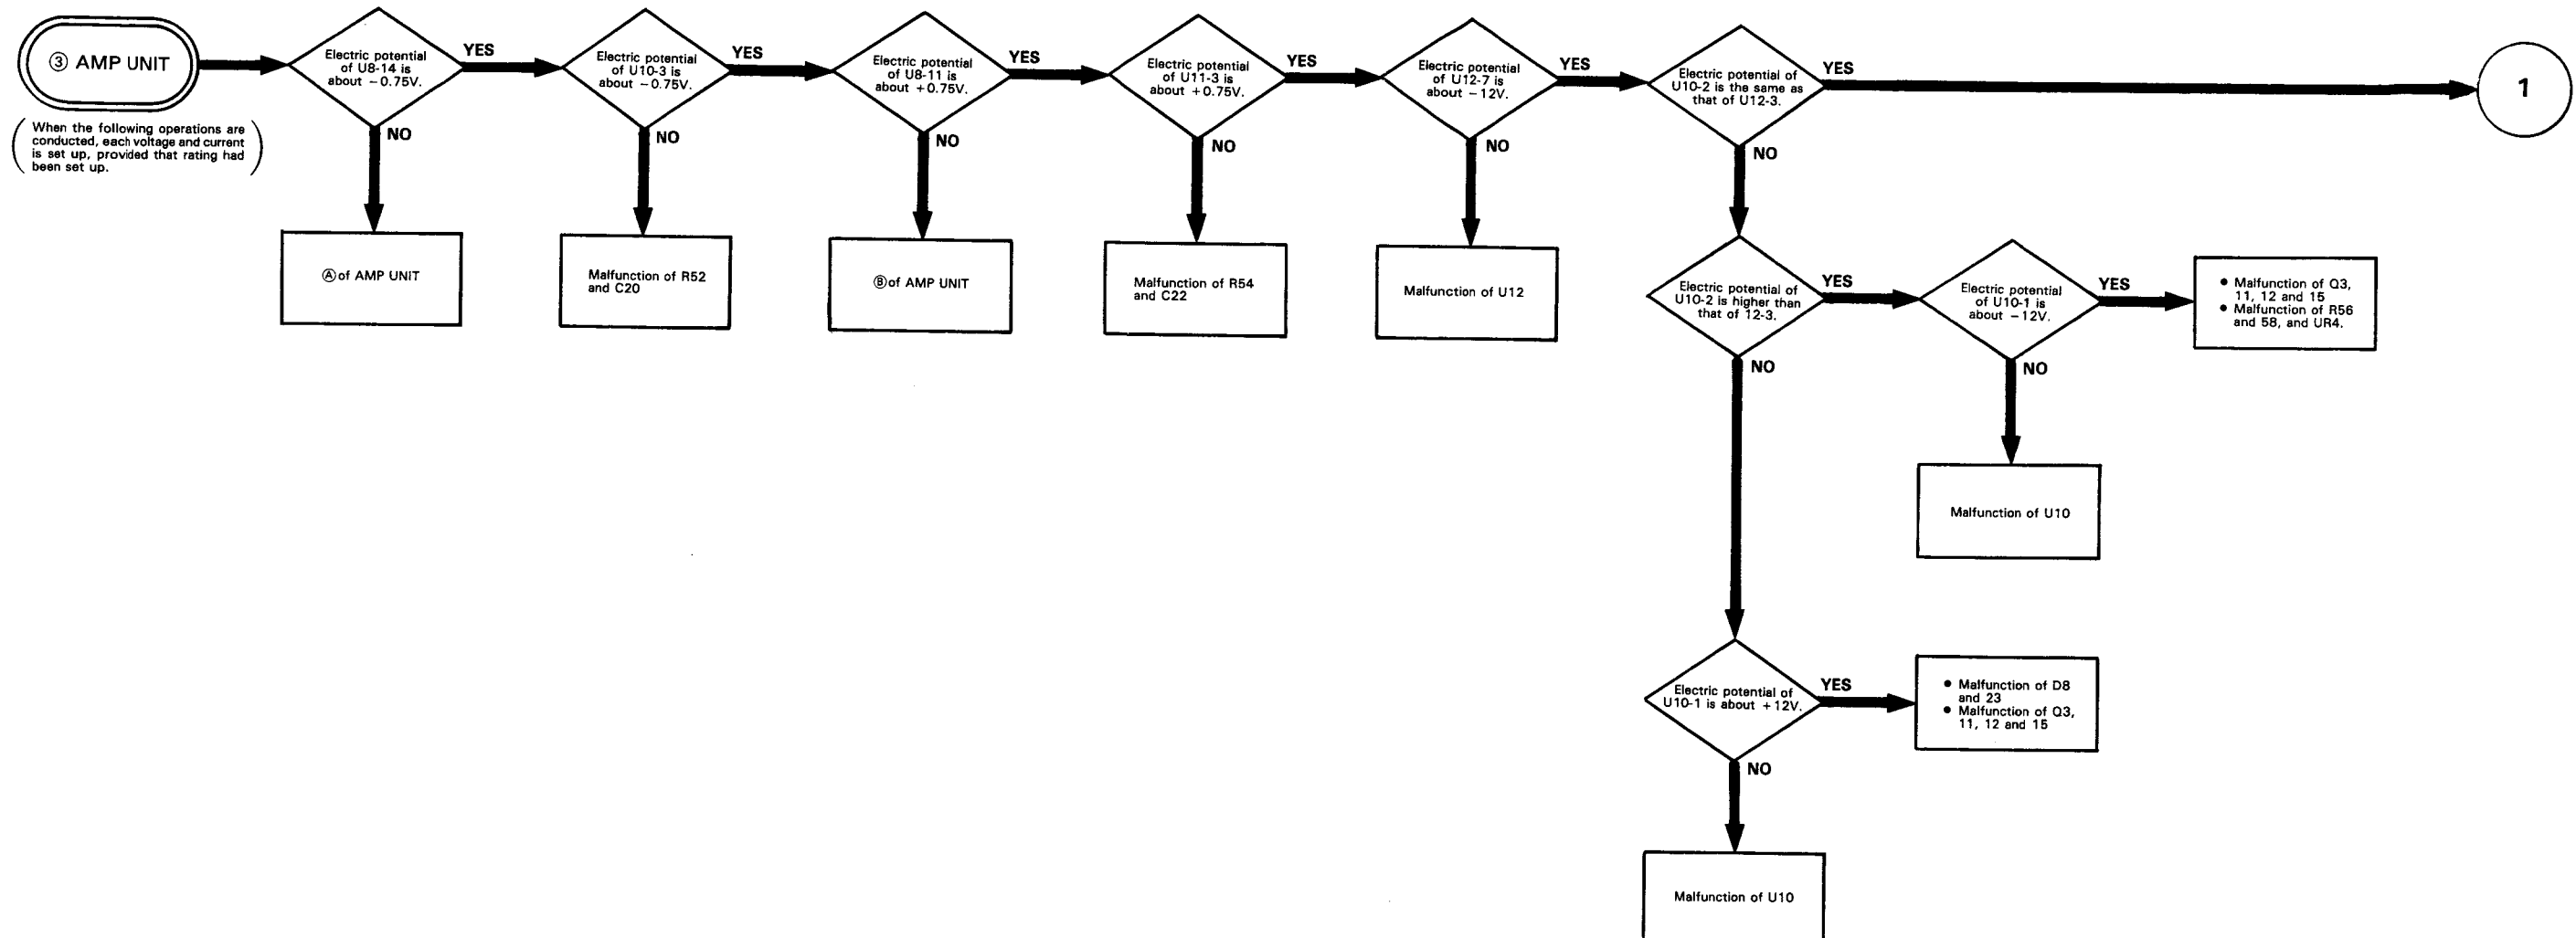

# TROUBLESHOOTING

Symptom: When both outputs are used in CC state, the  $\pm 18$  ( $\pm 36$ ) LEDs do not blink.

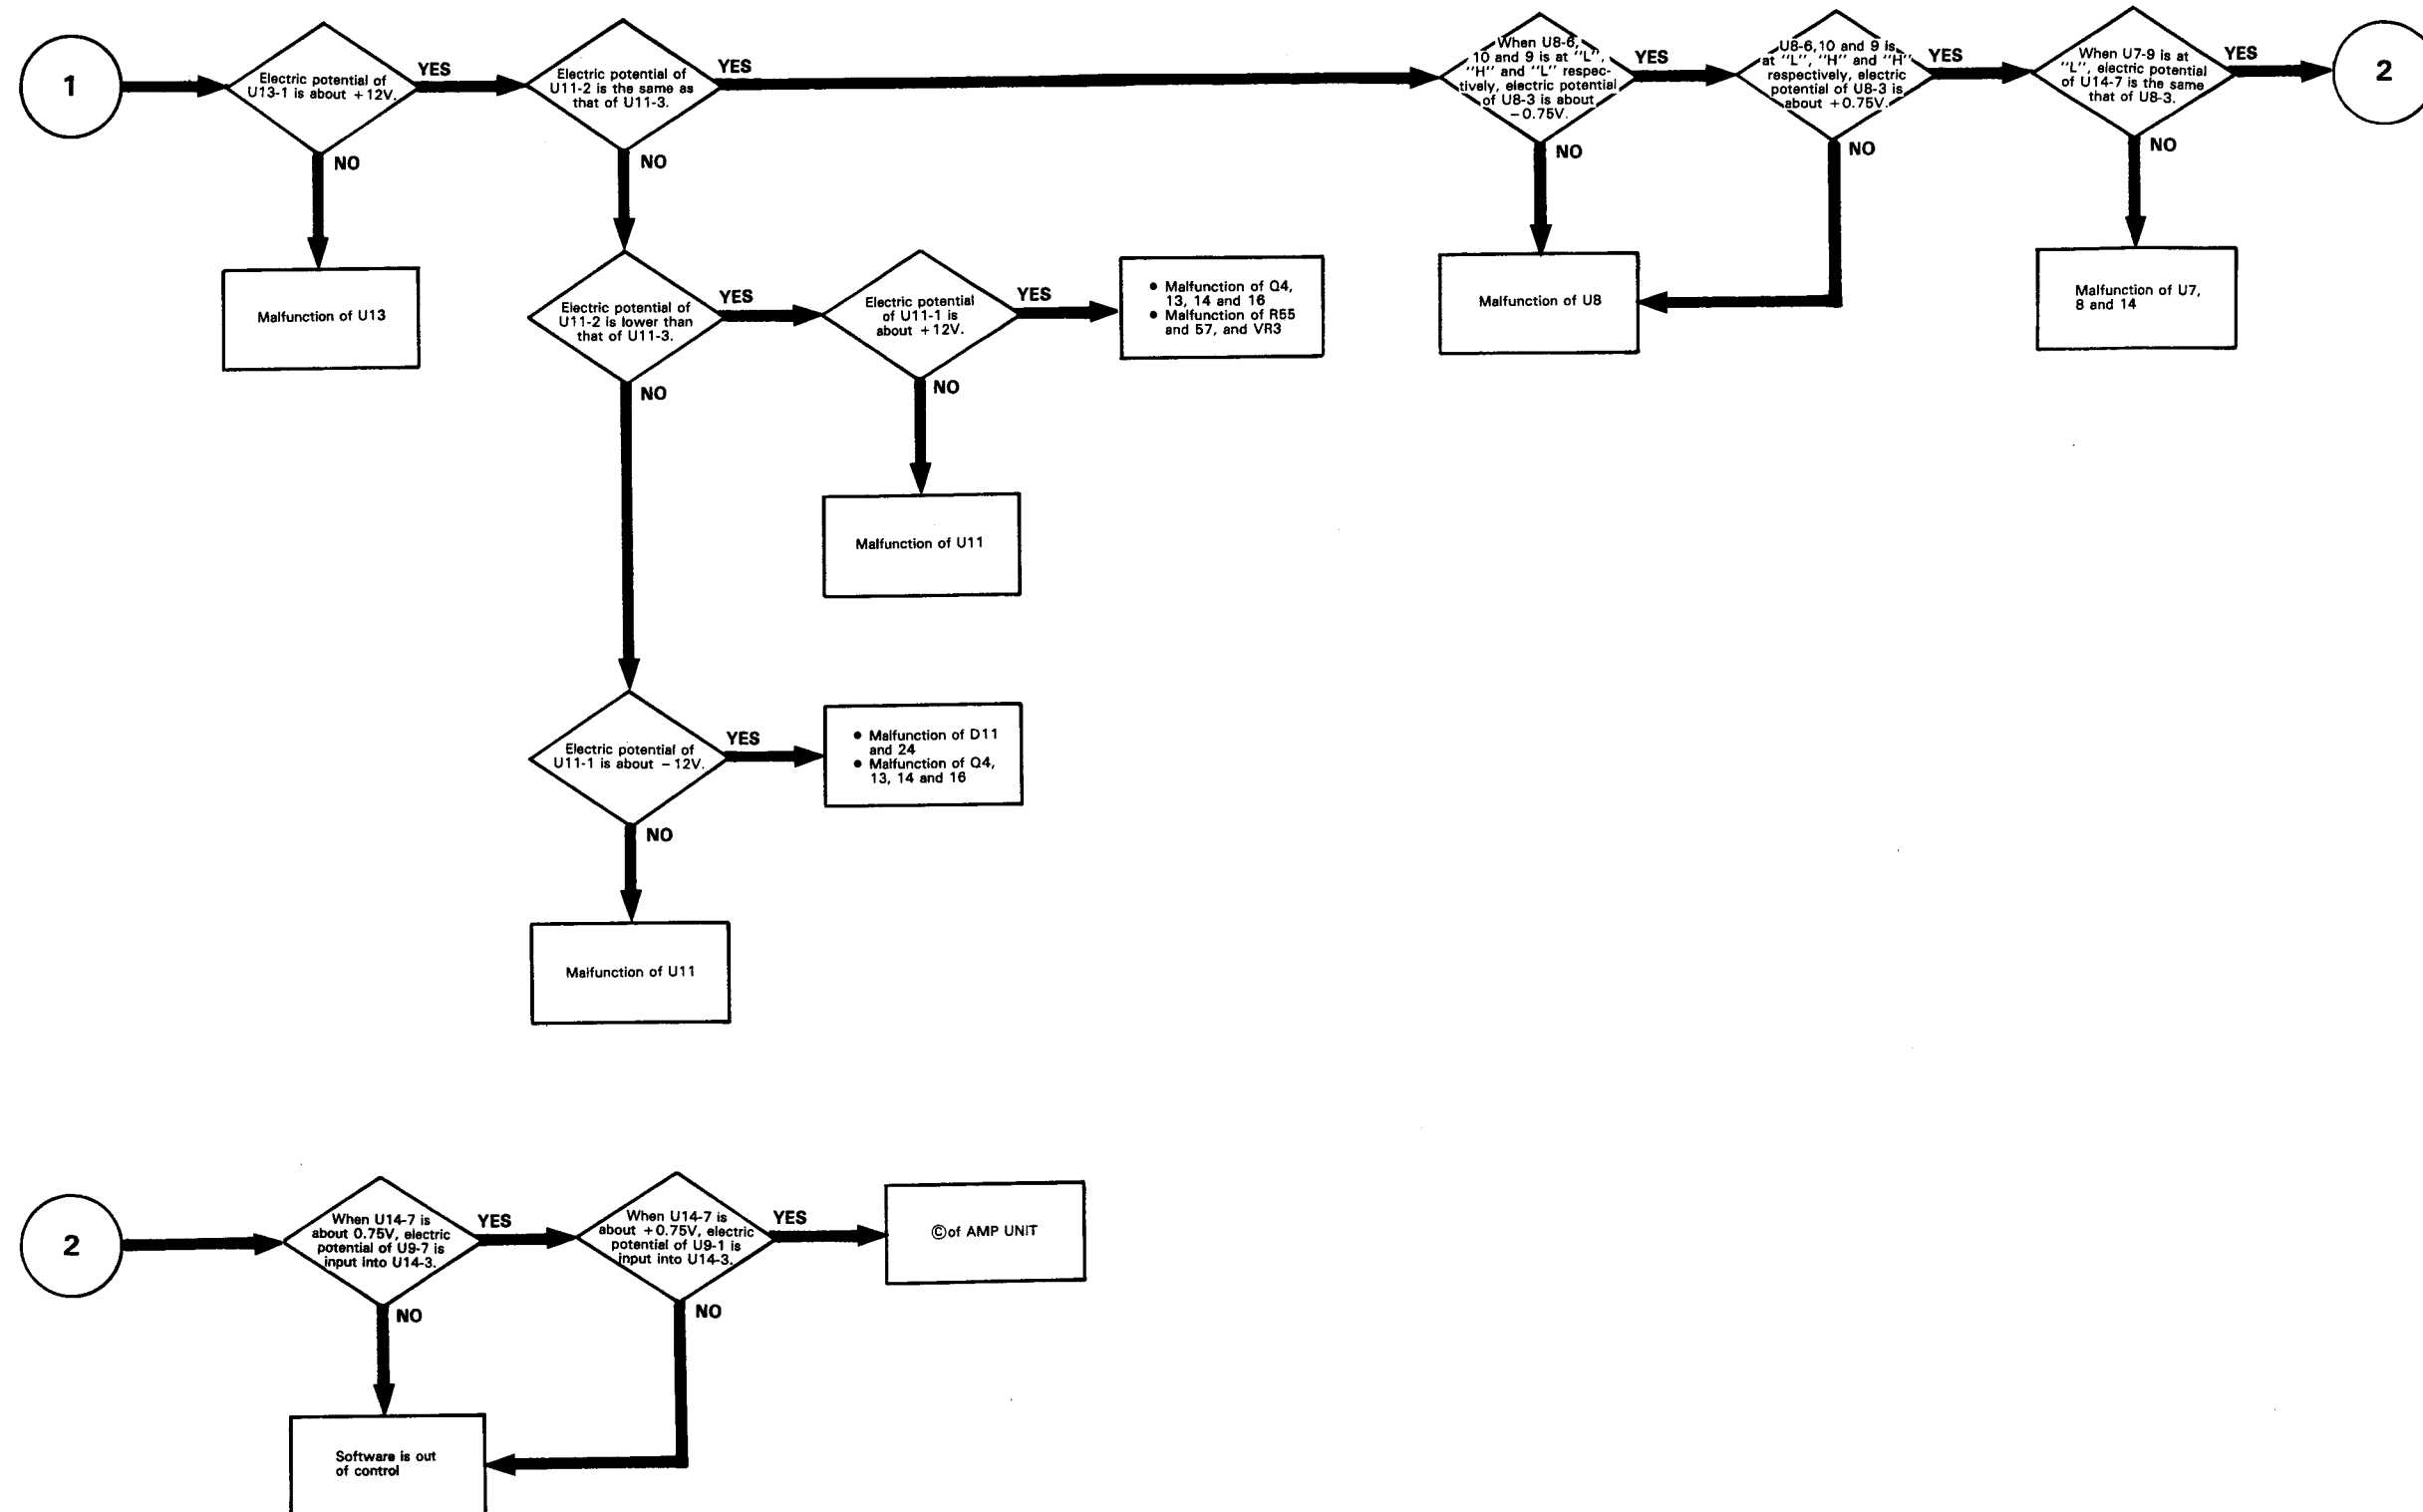

Symptom: When the OUTPUT is switched ON by shorting the output, the indicated current does not vary in accordance with the encoder operation.

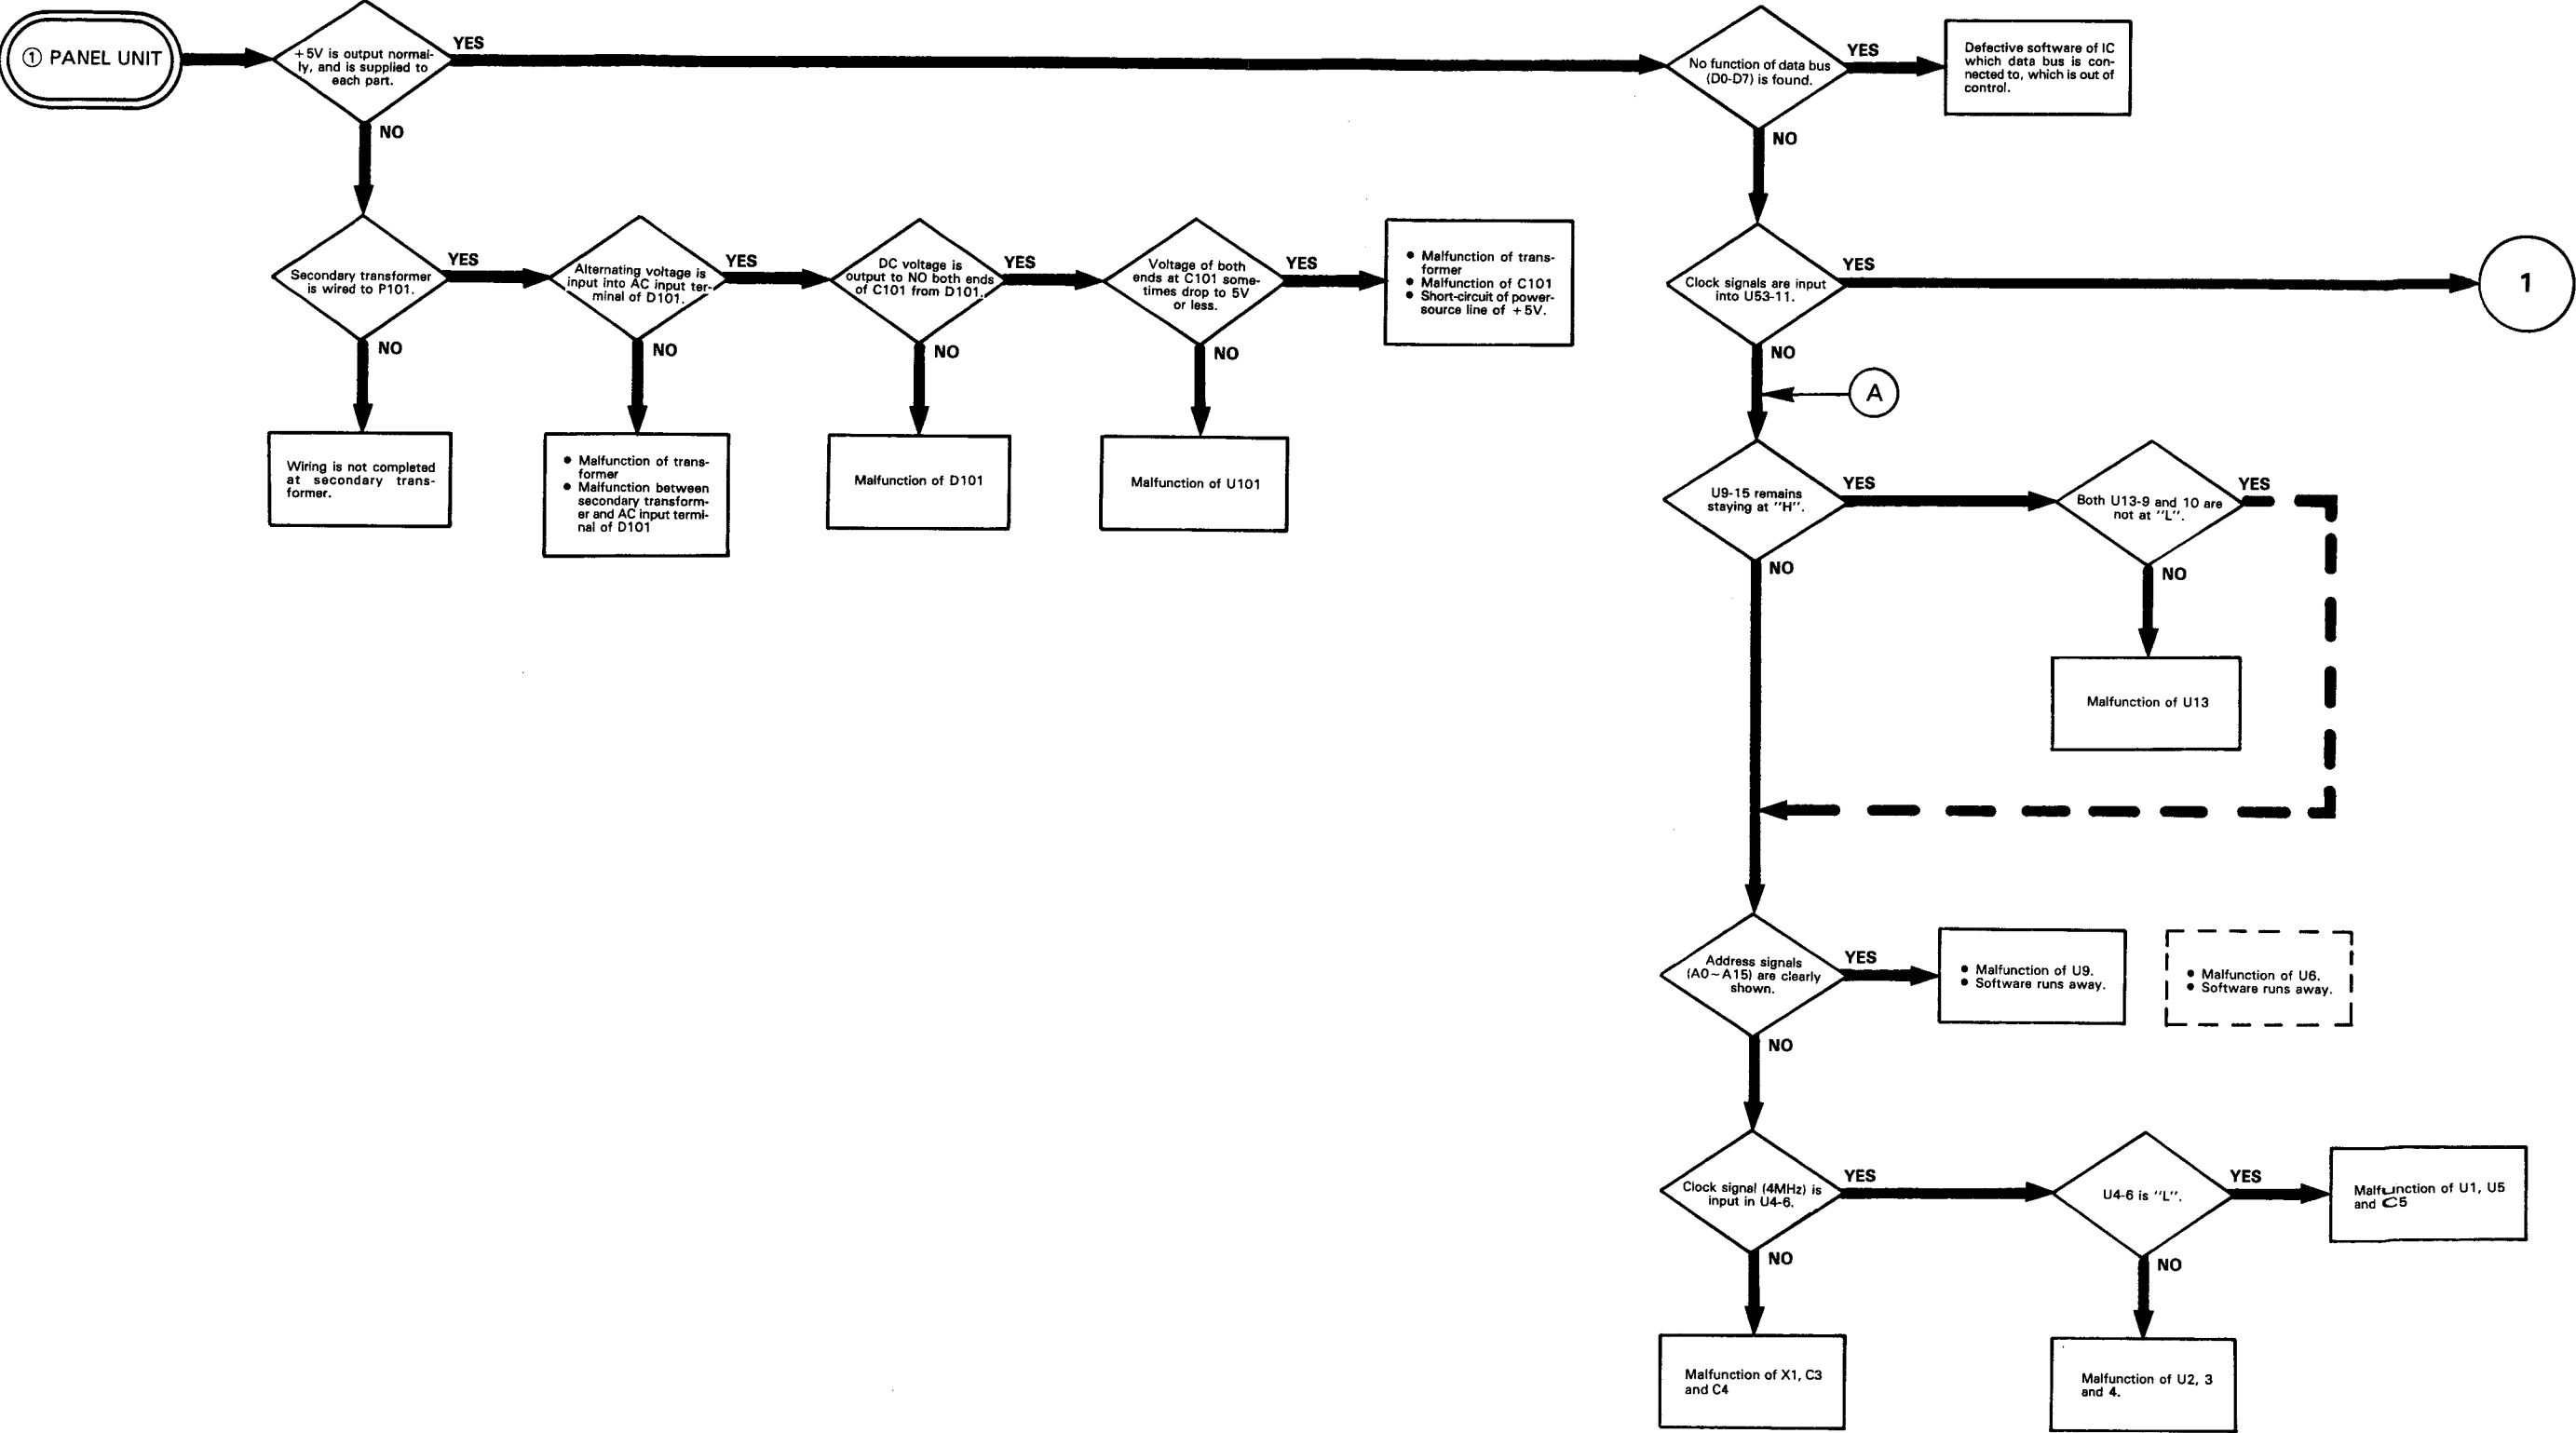

# TROUBLESHOOTING

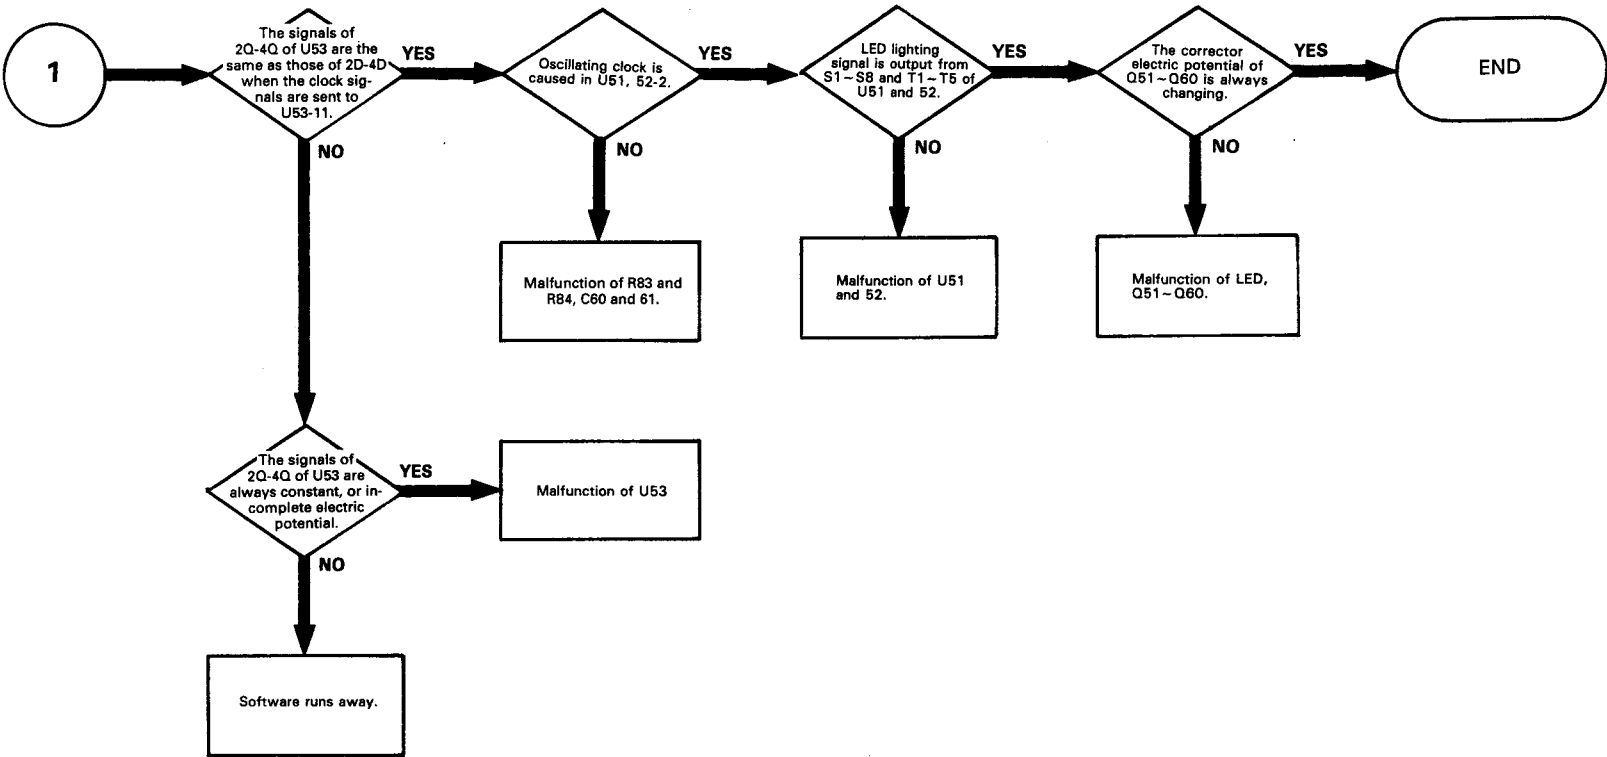

# TROUBLESHOOTING

Symptom: The LEDs do not light.

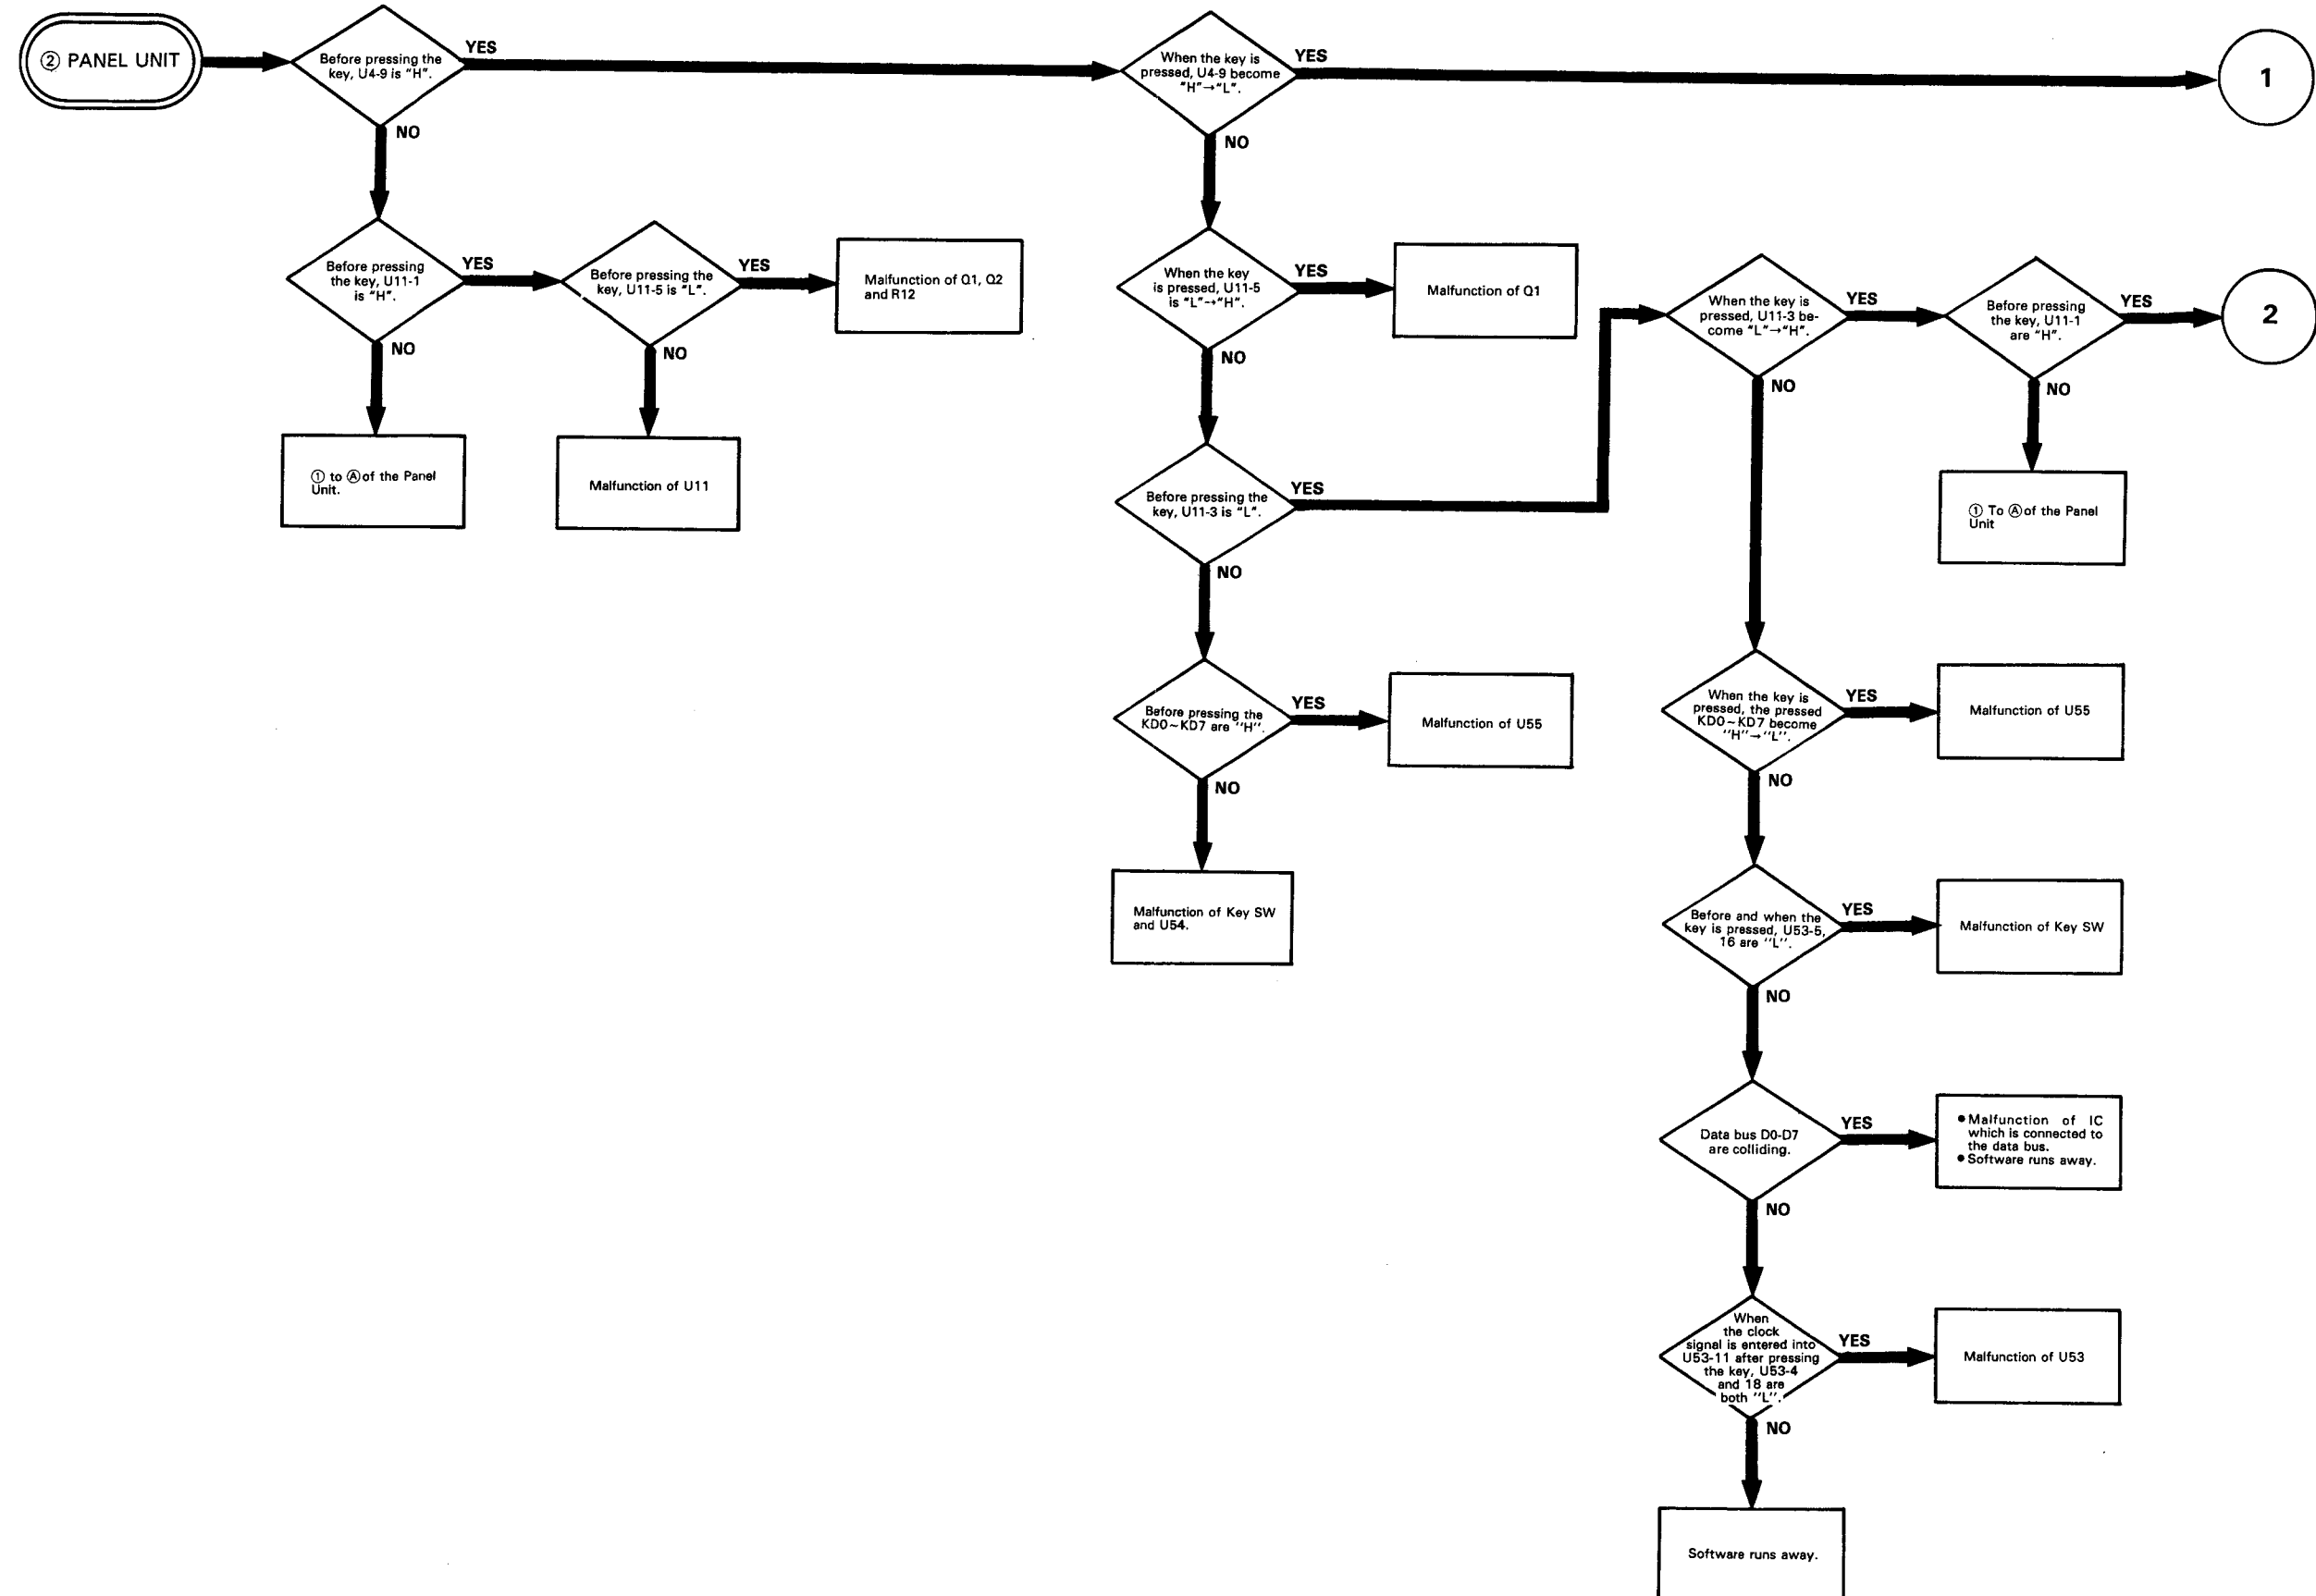

TROUBLESHOOTING

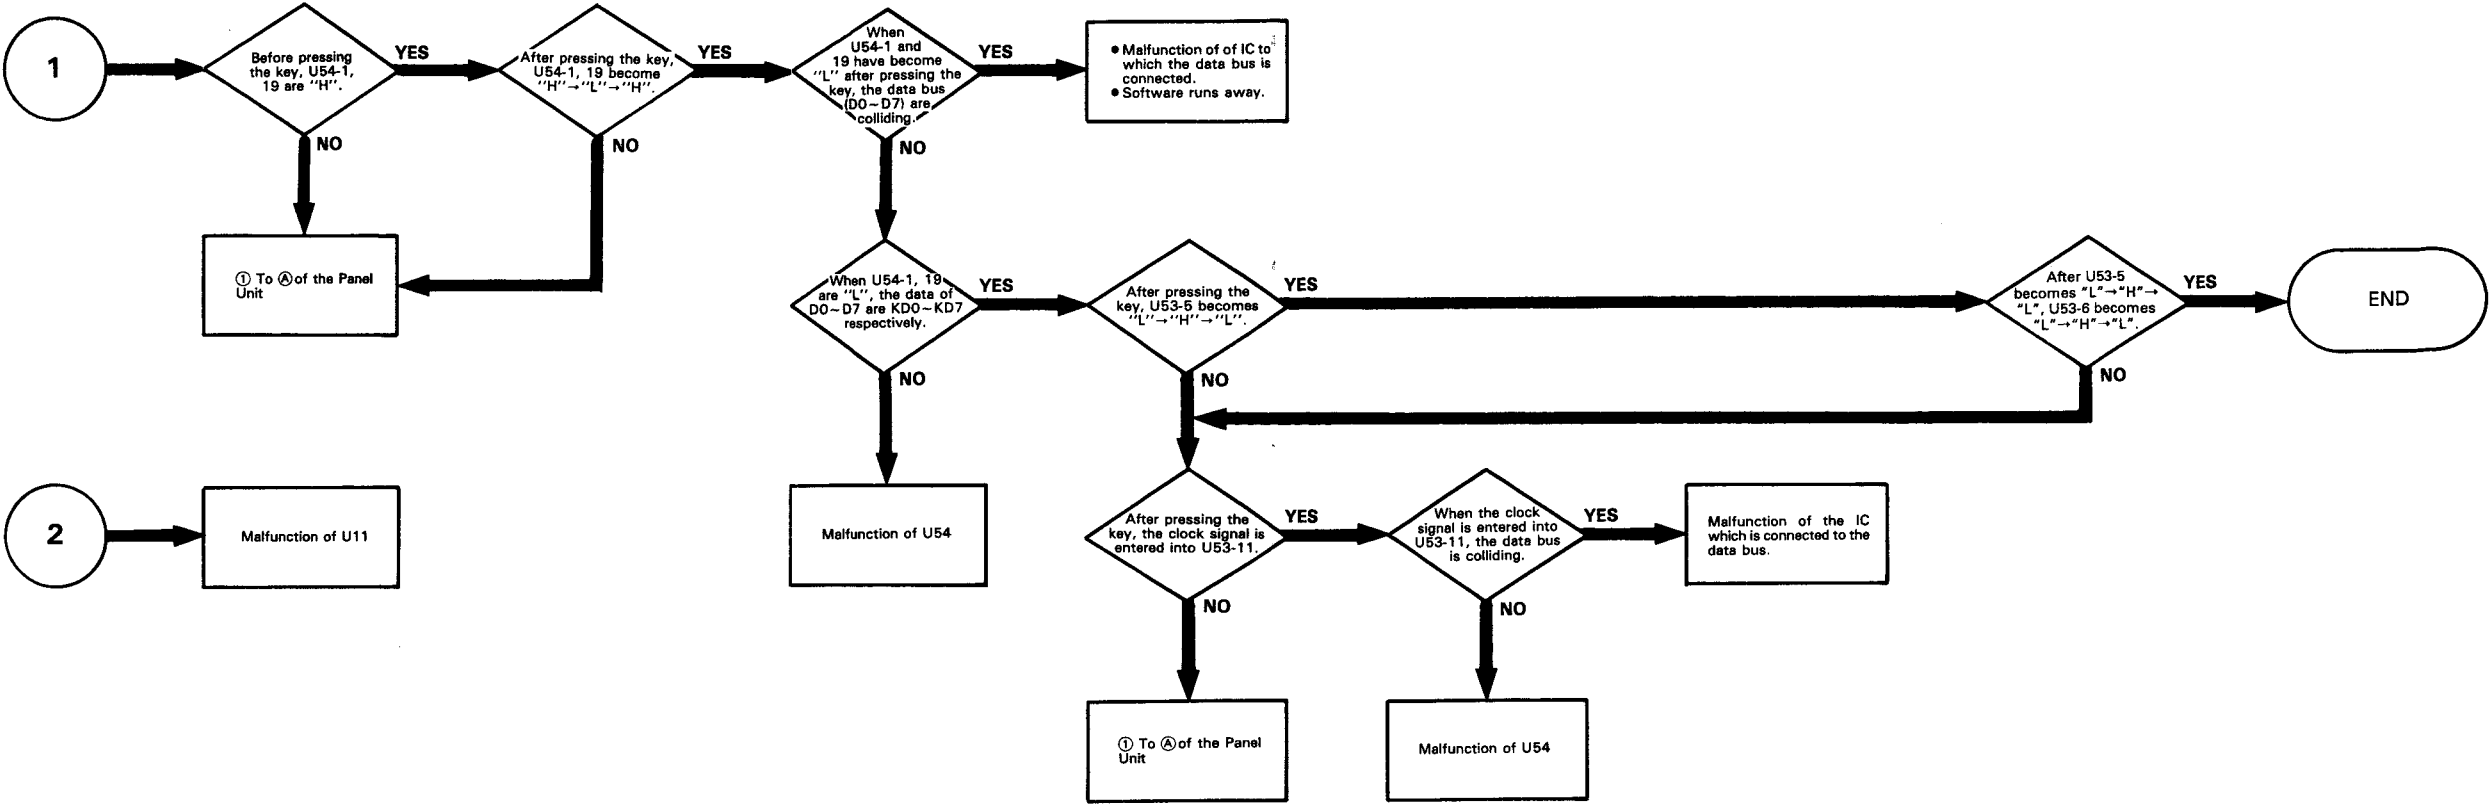

# TROUBLESHOOTING

Symptom: The operation requested by pressing a key does not occur.

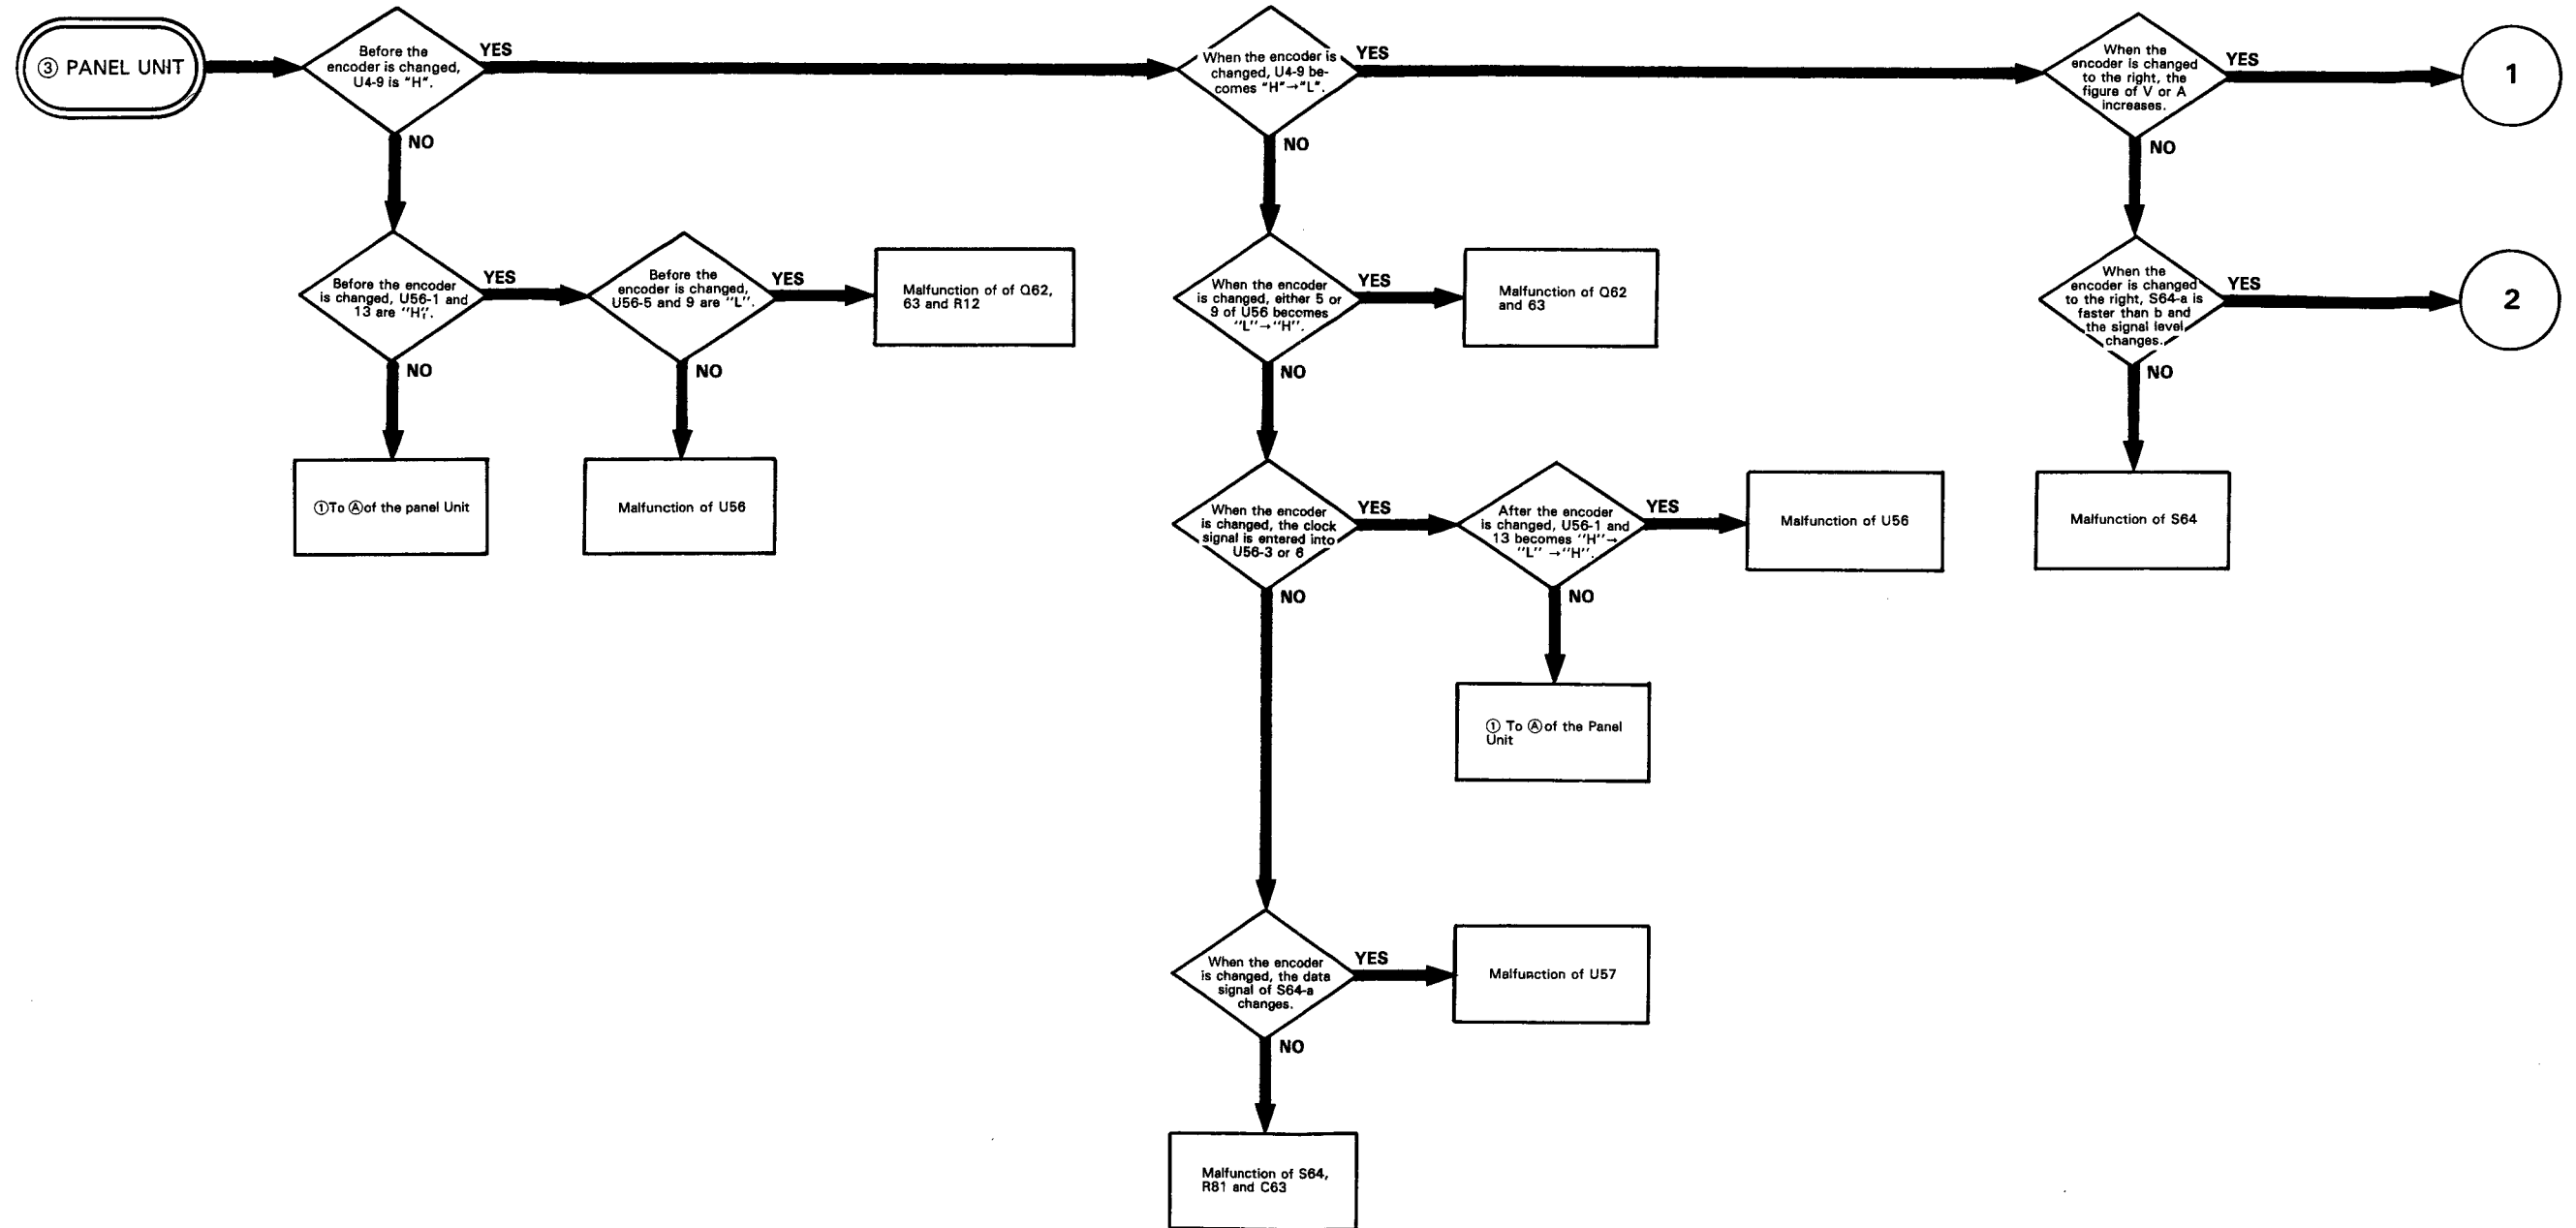

TROUBLESHOOTING

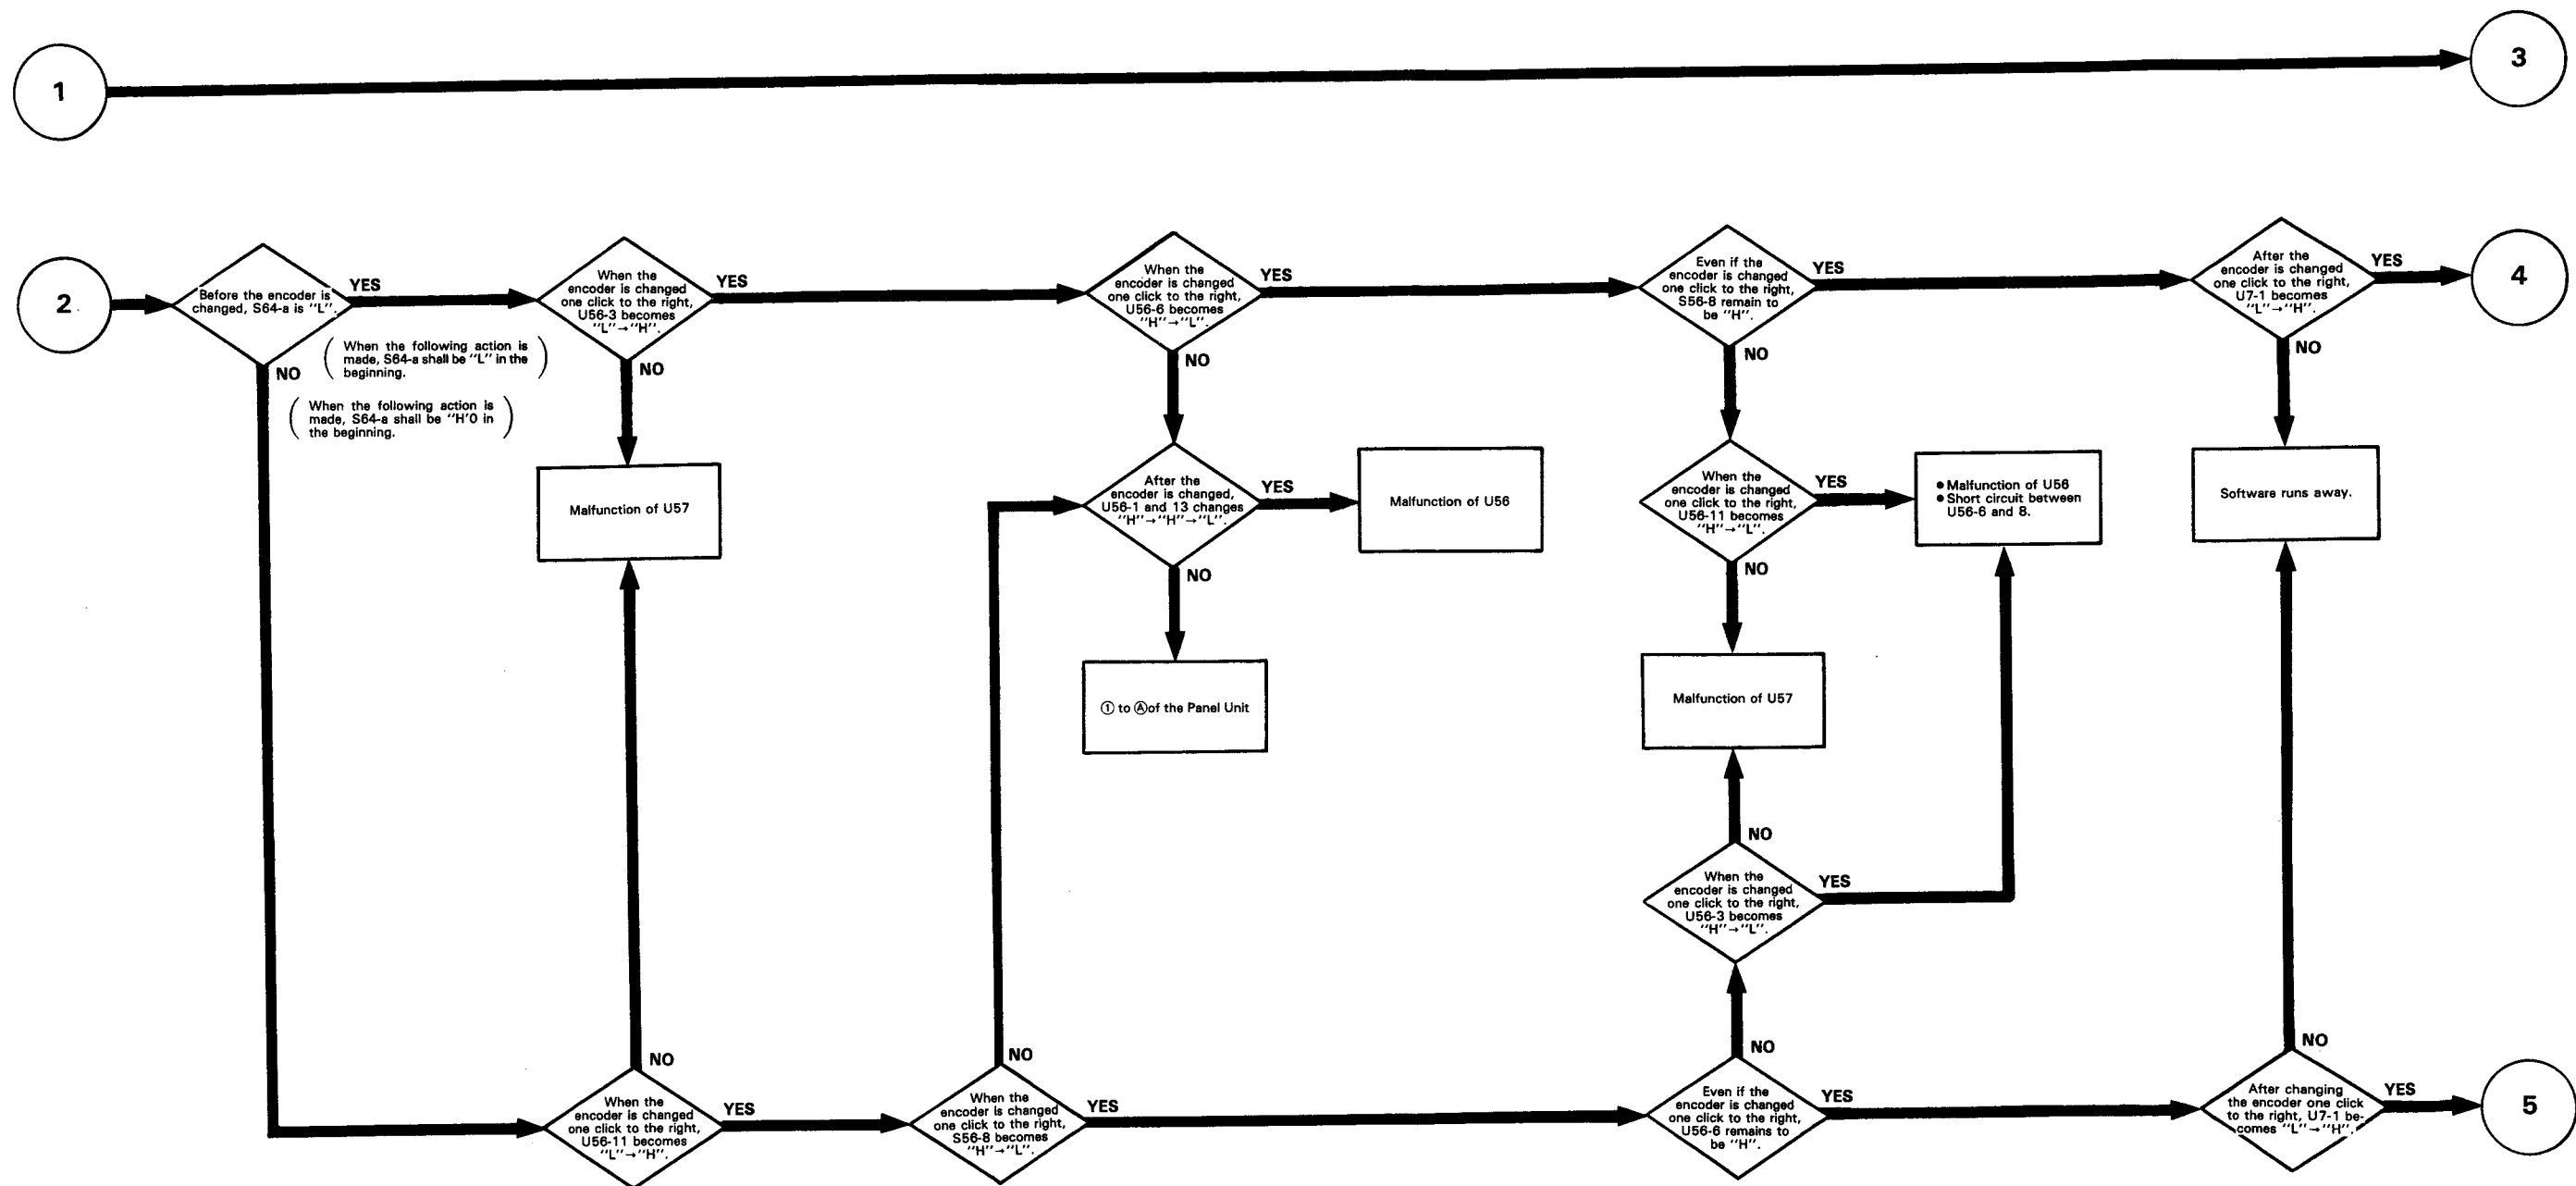

# TROUBLESHOOTING

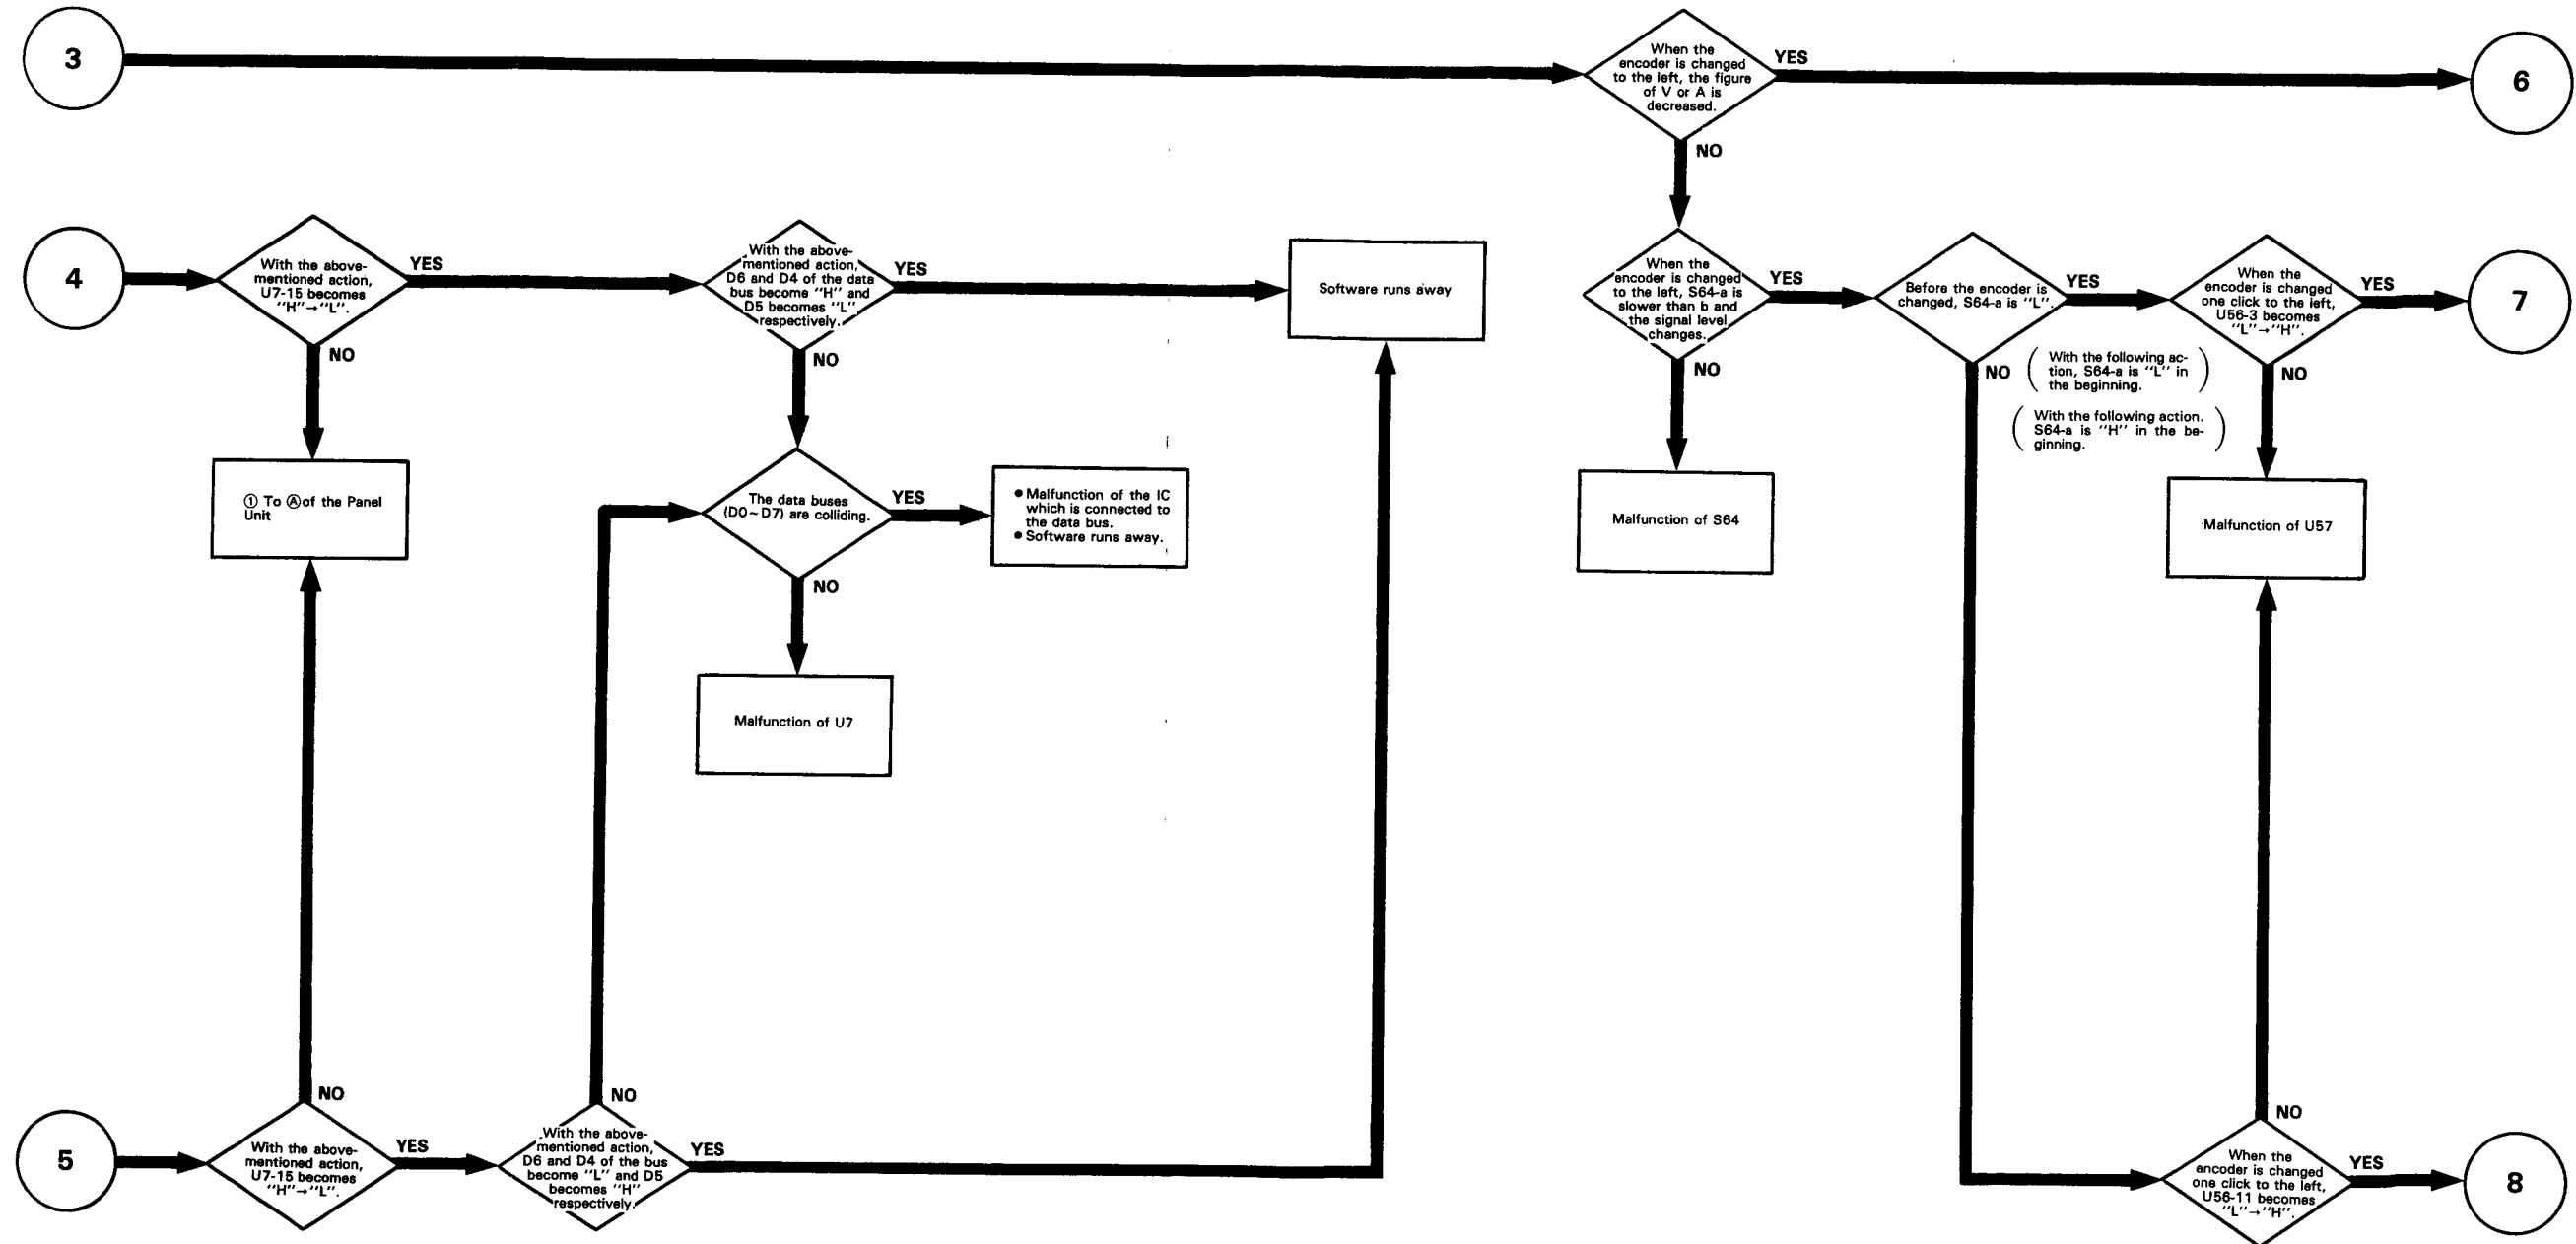

Symptom: When the V and A are varied with the encoder while the MEMORY LED is lit, the indicated V and A do not vary in accordance with the encoder operation.

# TROUBLESHOOTING

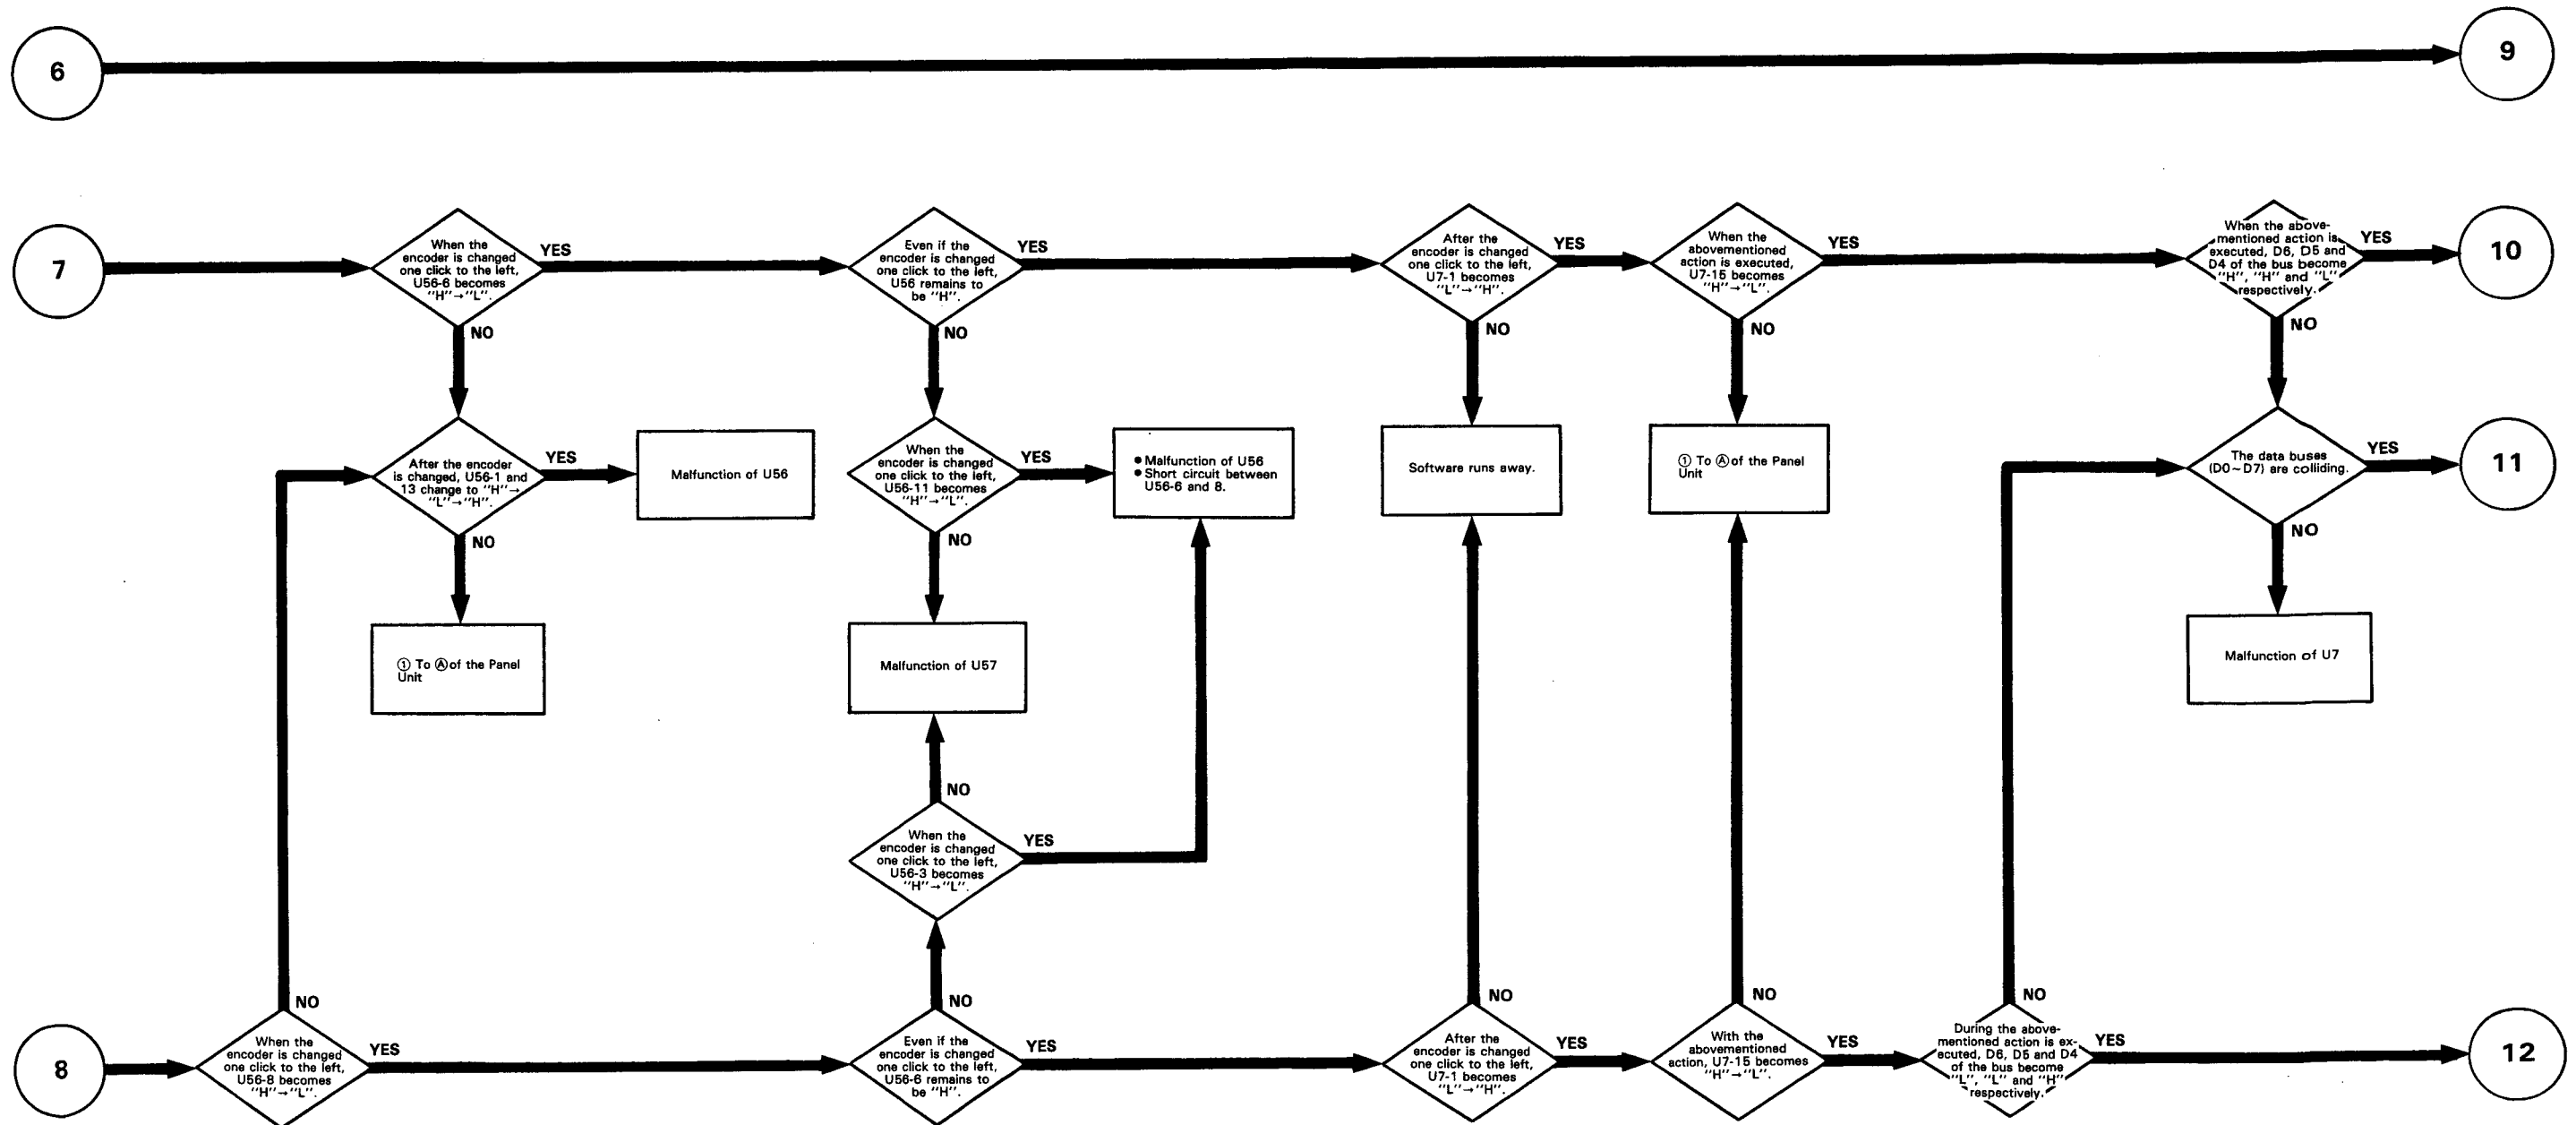

# TROUBLESHOOTING

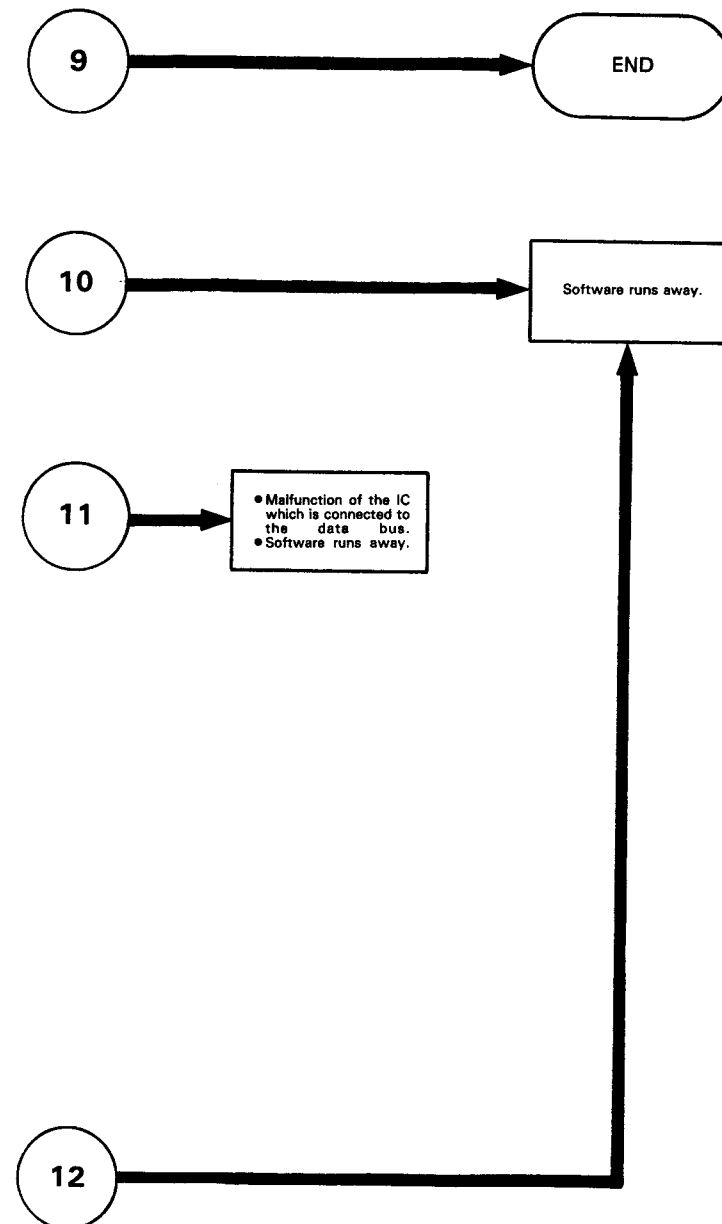

# TROUBLESHOOTING

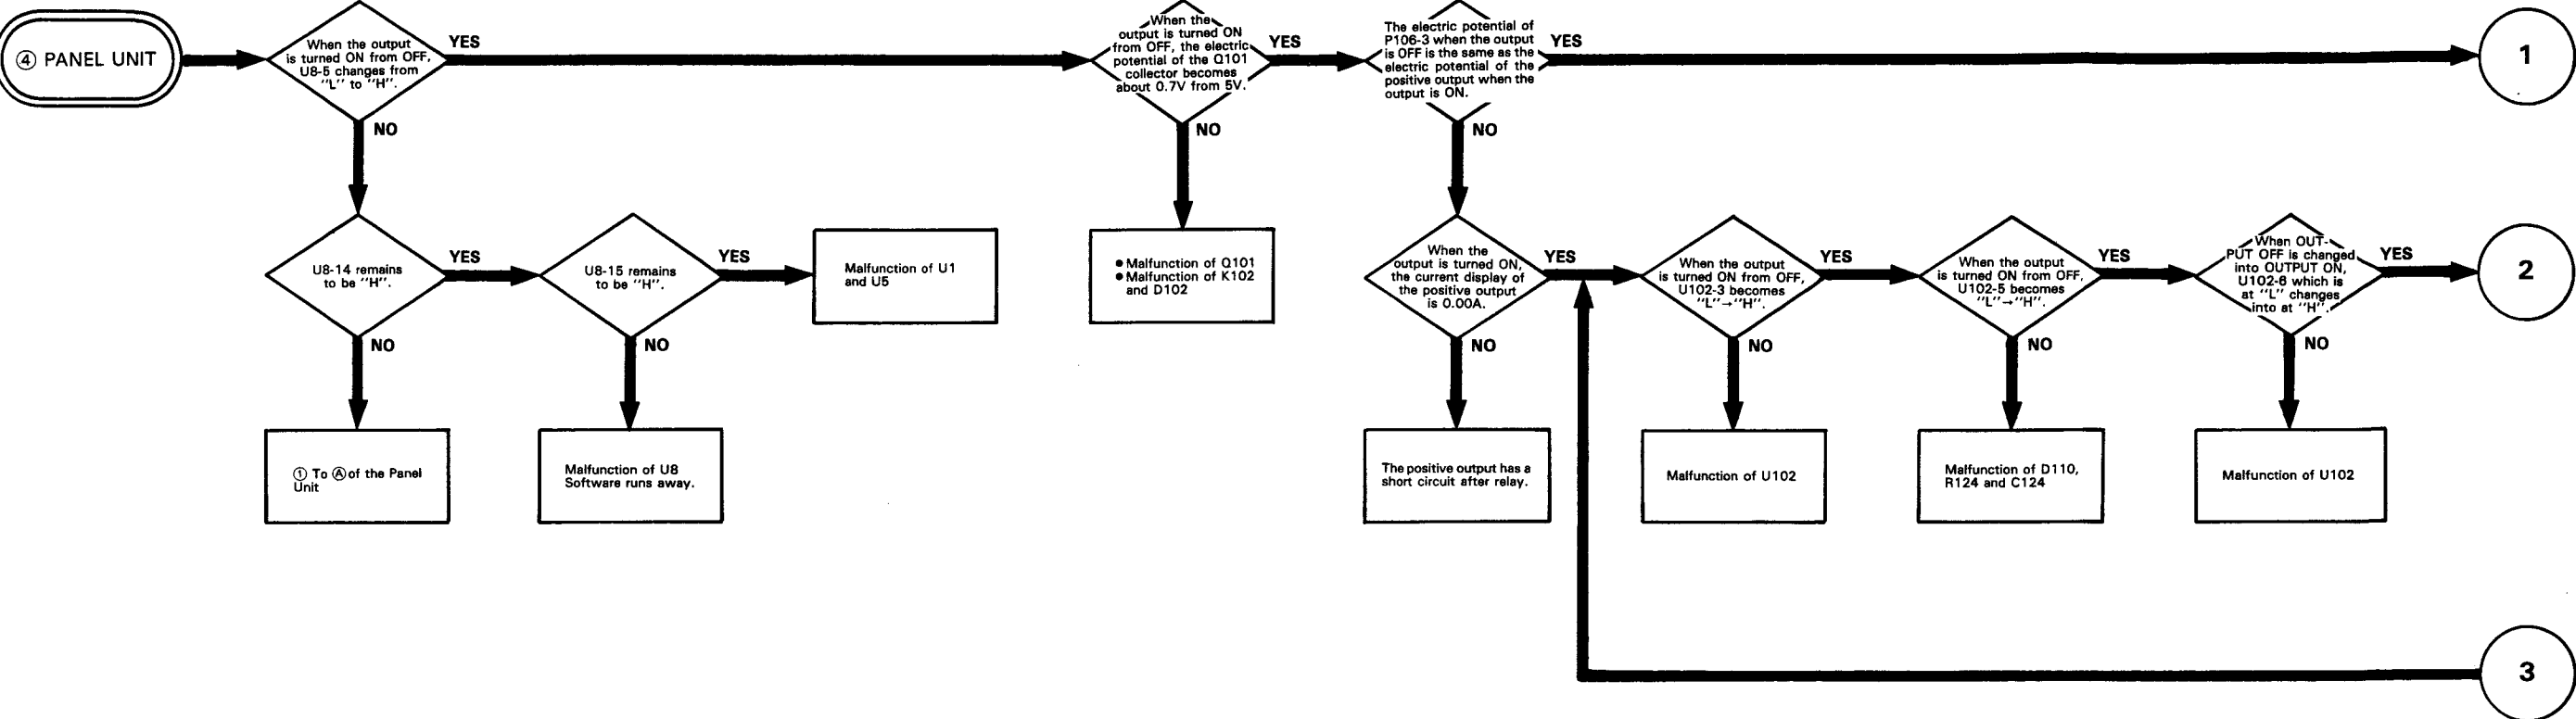

## TROUBLESHOOTING

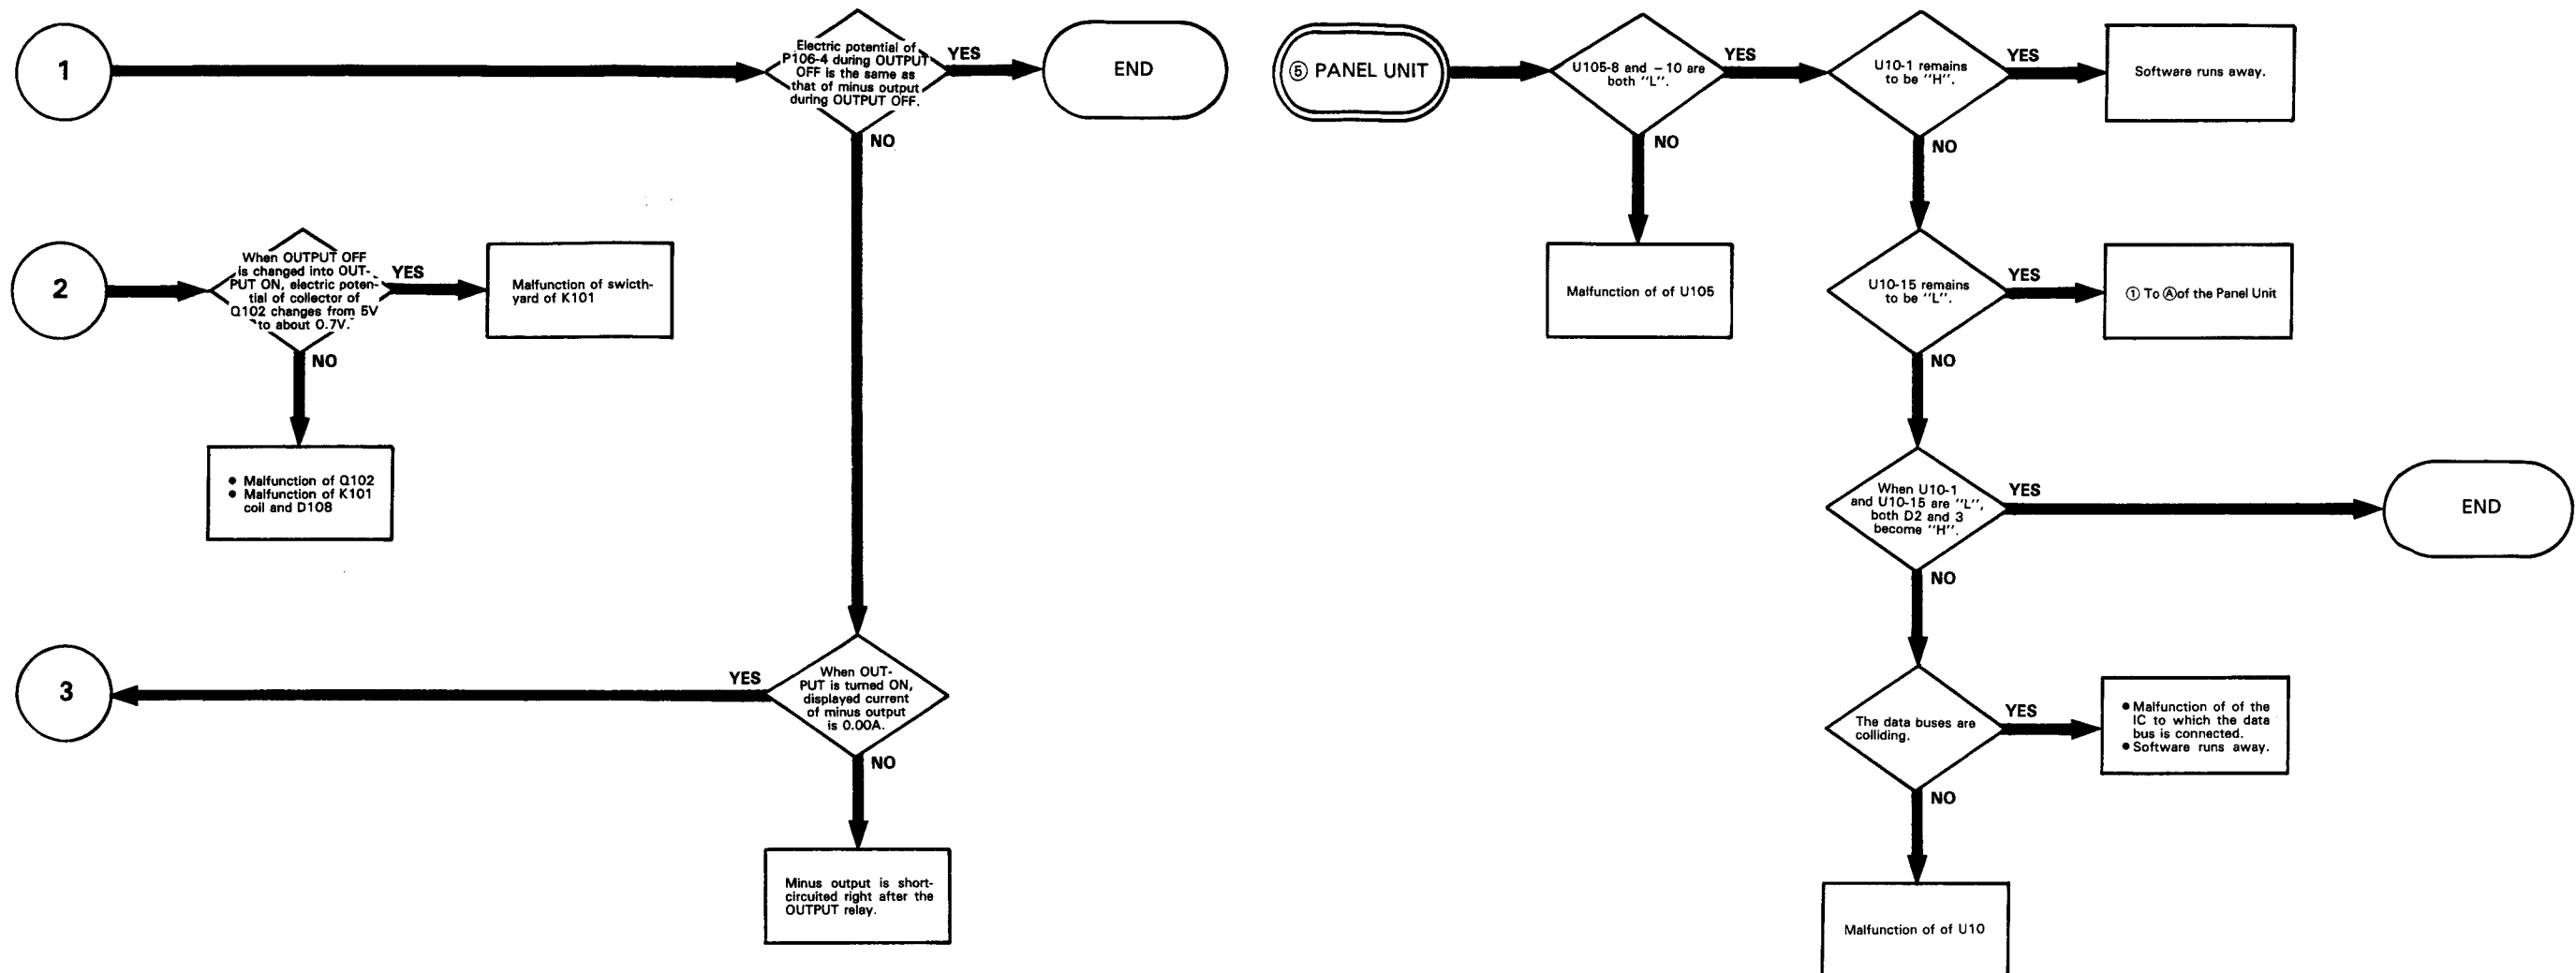

# TROUBLESHOOTING

Symptom: When the OUTPUT is switched ON while there is no load, the output voltage is not as indicated by the voltage indication.

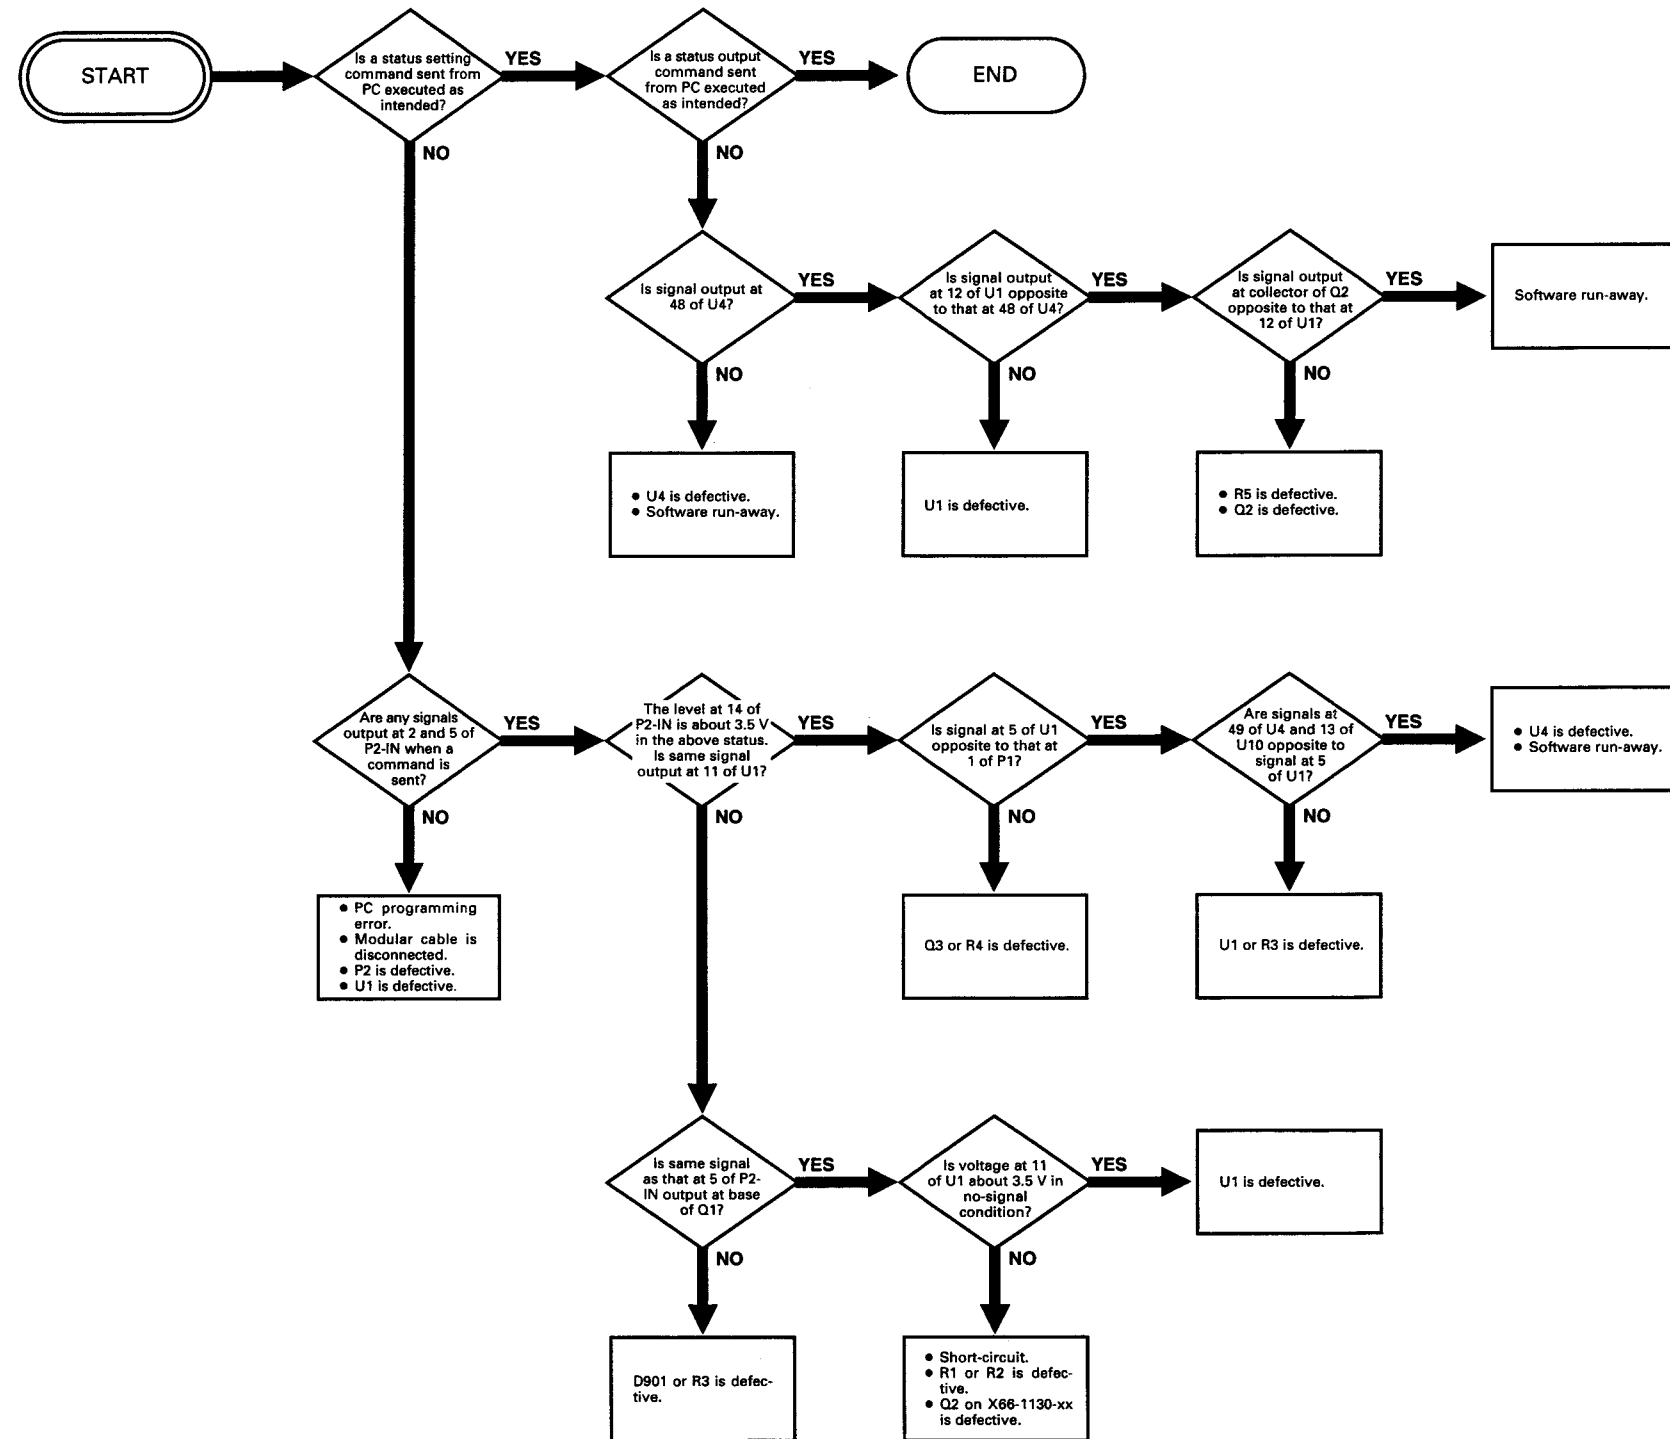

# TROUBLESHOOTING

Symptom: When both outputs are used in CC state, the  $\pm 18 (\pm 36)$  LEDs do not blink.

## DIAGRAM (PWR18-2)

# WAVEFORM

## WAVEFORM

①

P4-2 Waveform  
In case of X73-1880-01,  
it takes DATA Waveform.

P4-3 Waveform  
In case of X73-1880-01,  
it takes STROBE Waveform.

50µs/div

④

U4-6 Waveform, CPU  
Clock Waveform

0.5ms/div

②

P4-1 Waveform  
In case of X73-1880-01,  
it takes CLOCK Waveform.

P4-3 Waveform

0.2ms/div

⑤

U51 and 52-2 Waveform

5µs/div

③

P4-1 Waveform

P4-6 Waveform  
In case of X73-1880-01,  
it takes P20-10 Waveform.

5ms/div

⑥

U102-2 Waveform  
(for K101 disturbance)  
During OUT-  
PUT is ON

U102-6 Waveform  
(for K102 disturbance)

U102-7 Waveform  
(for K101 disturbance)  
During OUT-  
PUT is OFF

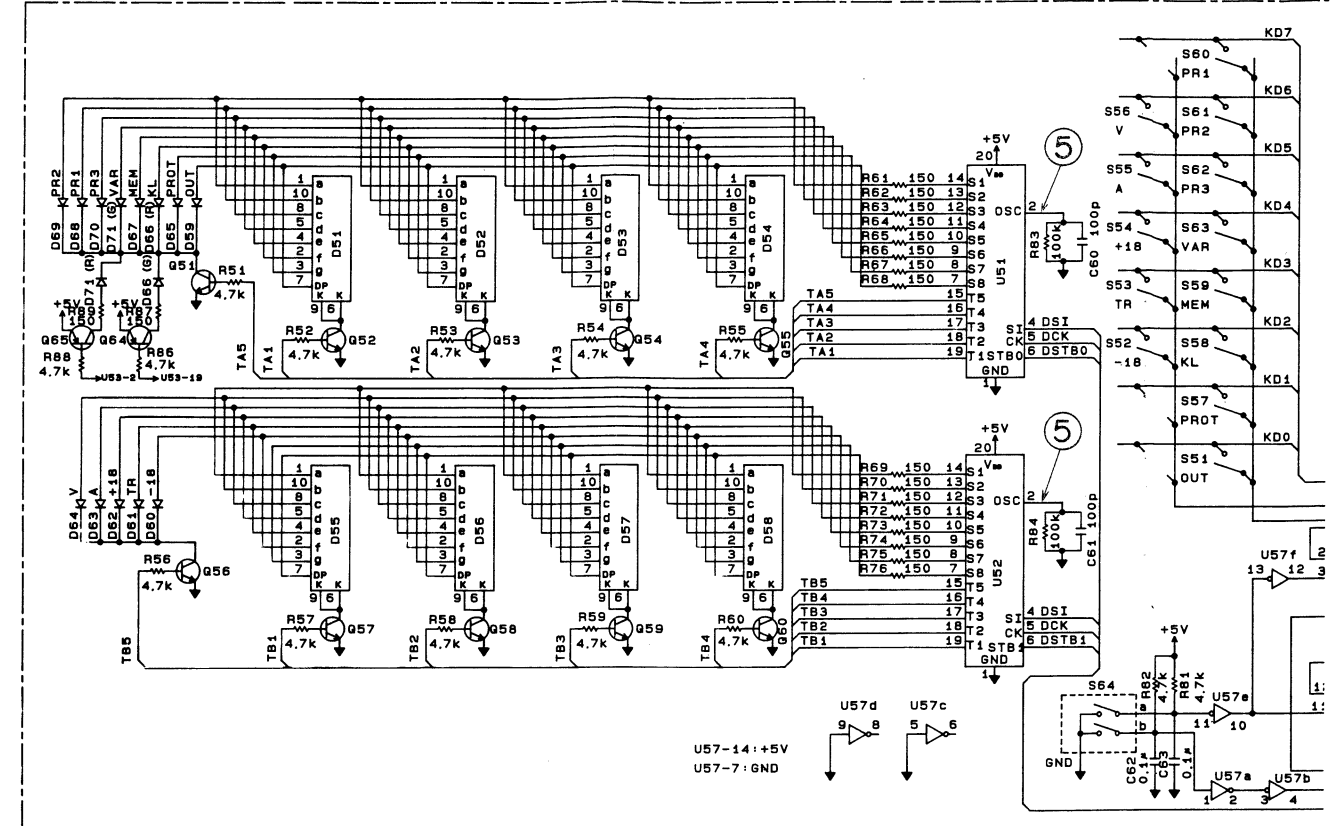

U102-8 Waveform  
(for K102 disturbance)

3V/div, 5ms/div

AMP & TERMINAL UNIT

## DIAGRAM (PWR18-2)

## AMP & TERMINAL UNIT

# WAVEFORM

**P20-8 Waveform**  
Since it is DATA waveform, it does not always take this waveform.

**P20-7 Waveform**  
**STROBE Waveform**  
It sends data sent in serial forms into U3, and performs data shift.

U14-3 Waveform

OUTPUT is ON.  
Output terminal: Short-circuit  
Output current: Rating

U14-2 Waveform

**P20-9 Waveform**  
**CLOCK Waveform**  
It outputs data sent in serial forms from U3 and 4 as parallel data.

**P20-7 Waveform**  
**STROBE Waveform**  
Since volume of data is 24 ( $3 \times 8$ ), one set of this waveform consist of 24 pulses.

**P20-10 Waveform**

Since this waveform is compared by a comparator on a serial manner it does not always take this waveform.

### U14-1 Waveform

### U7-1 Waveform

OUTPUT is ON.  
Set-up voltage: Rating  
Set-up current: Rating  
Load: No load

### U7-2 Waveform

When K1 is at high tap	Input AC100V Output current: $\pm 2A$
When K1 is at low tap	
When K2 is at low tap	
When K2 is at high tap	

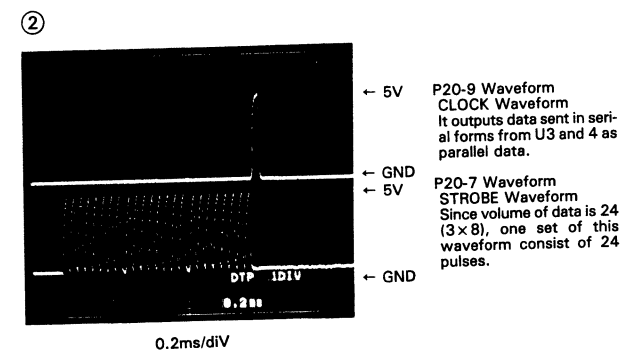

### U14-3 Waveform

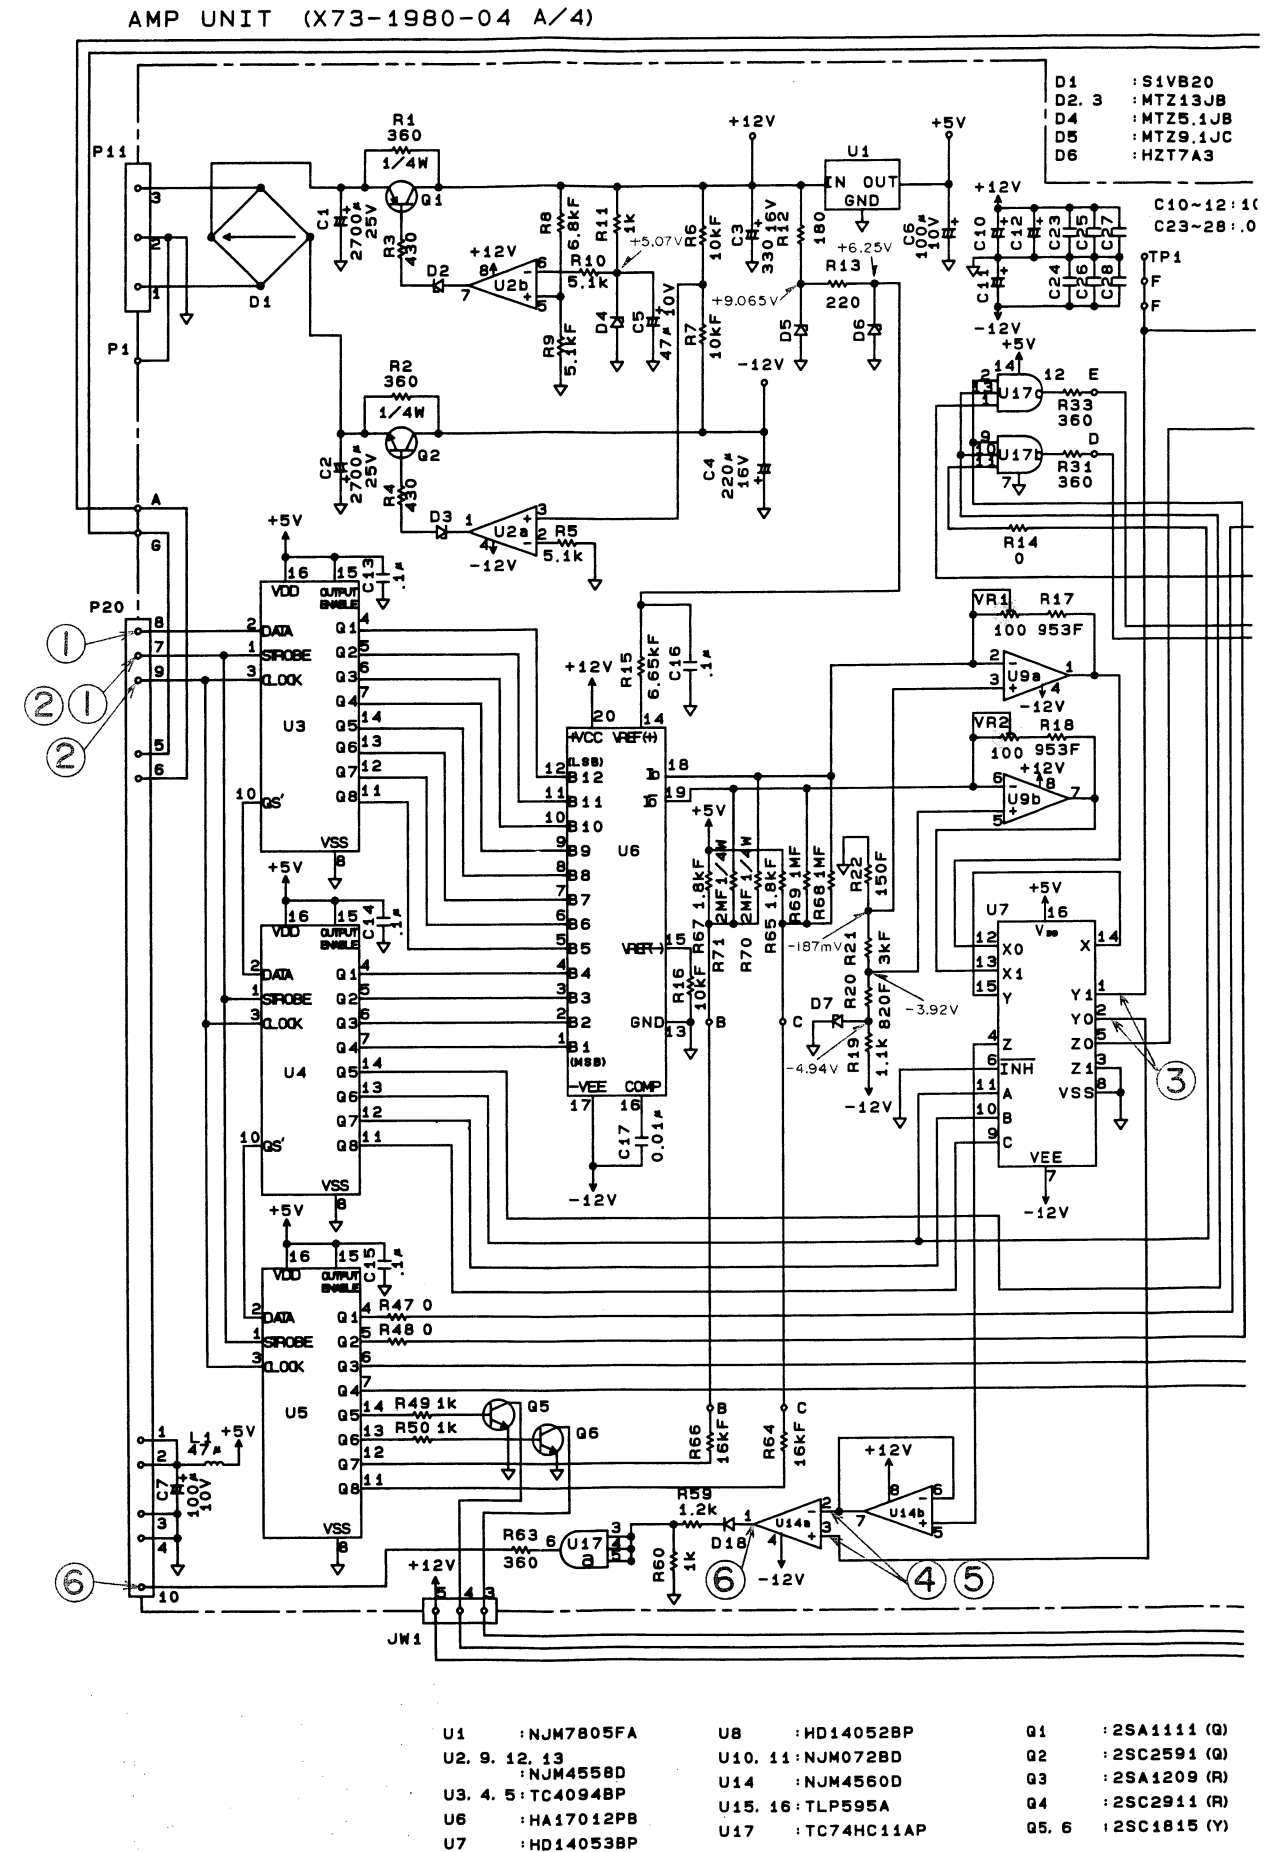

OUTPUT is ON.  
Output voltage: Rating  
Output current: 0A

### U14-2 Waveform
